LETTER OF TRANSMITTAL

RALEIGH, N. C., December 13, 1913.

HON. W. A. GRAHAM,

Commissioner of Agriculture,

Raleigh, N. C.

Sir:—Herewith find my annual report of Farmers' and Women's Institutes for the current year, which I recommend for the January, 1914, Bulletin.

Respectfully,

T. B. PARKER,

Director of Farmers' Institutes.

Approved for printing: W. A. Graham,

Commissioner.

REPORT OF FARMERS' INSTITUTES, 1913

By T. B. Parker, Director of Farmers' Institutes.

During the year, December 1, 1912, to December 1, 1913, we held 260 institutes, each for men and women, with total attendance as follows:

At	Regular	Farmers'	Institutes34,978
At	Regular	Women's	Institutes23,007

In addition to the above we held a two-days Normal Institute for institute lectures, a three-day round-up institute and four institutes for

negroes.

In many sections we had the hearty cooperation of ministers, school teachers, physicians, and business men, as well as the farmers. We are especially indebted to the newspapers for the many notices they have given of the institutes, and in some instances they have printed the programs in full. We very much appreciate their kindness in this respect.

No premiums were offered at the institutes for men, but premiums of a year's subscription to a woman's magazine were offered to the woman living on the farm, who made and exhibited the highest scoring loaf of bread, and to the woman living on the farm who prepared and exhibited the test school lunch under the conditions set forth in the following circular sent to applicants for information in regard to the exhibits:

Explanations of Premiums Offered at Women's Institutes.

The following explanations in regard to the premiums that we are offering to the girls and women living on the farm for the best exhibits of bread and school lunches at our women's institutes may be of value to would-be exhibitors.

The school lunch exhibit is open to women over 18 years of age only; and the bread exhibit to girls and women. This ruling will be strictly adhered to. In either exhibit the exhibitor must sign a written statement, giving name, post-office address and age, that is, whether she is over or under 18, stating that she made the bread or prepared the lunch, place this information in an envelope, seal it and place with the exhibit. By this means the judge can be sure of getting the name and the address of the exhibitor.

The school lunch is deserving of more consideration than many parents give it. Childhood is an impressionable age and great care should be exercised as to influences that are brought to bear on the child during this critical period in its life. Influences that to us grown people seem small may leave an impression with children throughout their lives. For this reason we should be exceedingly careful as to the kind of influences that surround our children. Cleanliness, and neatness should be among the early impressions made upon the mind of the child. The school lunch is a good means of impressing the child with these habits, or perhaps I might say virtues, for they are virtues.

The school lunch should have three characteristics, appetizing, nourishing, and easily digested. A normal child of school age requires considerable food to meet the demands of up-keep and growth, so a school lunch should be sufficiently appetizing to induce him to eat freely. It should be composed of the things that will satisfy the hunger of a robust child, and at the same time be so easily digested as to permit the child to study in the afternoon rather than to be put to sleep from the effects of the lunch.

In preparing the school lunch avoid all soggy foods, all fried meats, unless a small quantity of well fried breakfast bacon may be permissible. Good bread and biscuits, boiled eggs, chicken and fresh meats, butter, sandwiches, ripe fruit, salted peanuts or other nuts, plain cakes and a bottle of fresh milk are sufficient to draw from and will supply the requirements of almost any school child. Sandwiches may be made from home grown vegetables with or without mayonnaise dressing as the child may prefer. The lunch should be put up in a neat basket or bucket and never in a pasteboard box. The latter is not as sanitary as the basket or bucket.

The basis of award will be as follows:

Neatness in	packing30	%
Suitability of	food to purpose40	%
Suitability of	food to season30	%

In judging bread the following score card will be used: Flavor, 35 points; crust—color, depth, texture, 20 points; lightness, 15 points; grain and texture, 10 points; crumb—color and moisture, 10 points; shape and size, 10 points. Size recommended, $7\frac{1}{2}x3\frac{1}{2}x2\frac{3}{4}$ inches.

No award will be given for bread scoring less than 75 points, nor for

school lunches scoring less than 70 points.

Williams, C. B		Farm Crops. Lime and its Use.
WINSTON. R Assistant Pathologist, Agricultural and Mechanical College.	1	Plant Diseases.
WINTERS	2	Cotton Growing.

County and Local Farmers' Institute Organizations.

Farmers' Institute Committees are appointed in all the counties where institutes are held. The duties of the members of the committees are to suggest places where the institutes are to be held, topics for discussion, advertise the meetings, look after the comfort of those attending the meetings, see that the house or hall in which the institute is to be held is put in good order before the hour for the institute to meet.

Farmers' clubs, local Farmers' Alliances, and local Farmers' Unions can greatly help the institutes by coöperating with the local institute committees and the conductor of the institute party. Such coöperation

is welcomed.

	STATE FARMERS' CONVENTION.	
G II II-bbo	President	Clinton, N. C.

WOMEN'S INSTITUTES, 1913

This is the first year we have ever held as many institutes in the State for women as we have for men. With each year interest and number in attendance increase. This is well. Someone has very truthfully said that "The home is the center of all life and that woman is the center of the home." This being true we can most effectively reach the people of the community through the women, therefore, it is well that we shall support with all diligence this feature of our institute work.

The first Women's Institutes held in the State were in 1906, when 21 institutes were held in 19 counties. Since then they have grown in numbers and attendance each year until this year we held 260 Women's

Institutes in 97 counties and with a total attendance of 23,007.

The following is a partial list of the subjects discussed at the Women's Institutes:

Health Hints. Care of the Sick. Care of Infants. What to do Until the Doctor Comes. Home Nursing. Home Sanitation. Bread Making. School Lunches. Best Methods of Cooking. The Fireless Cooker. Household Conveniences. Child Training. Invalid Cookery. Time-saving Appliances. Preventable Diseases. Insect Pests. The Home Garden.

The Country Woman and Her Relations to the Home and Community.

The Country Home.

Country Women's Organizations, etc.

County and Local Women's Organizations.

The plan of organization of the Women's Institutes is the same as for men. An active, interested woman is selected for chairman and she is given the best committee that can be selected to assist her. The chairman and other members of the committee are expected to work up interest in Women's institutes and endeavor to get the coöperation of all the progressive farm women of the community in securing attendance at the institutes. They are also expected to have committee meetings during the year to discuss among themselves questions pertaining to their work. They should invite the women of the community to join them at these committee meetings and take part in the discussions.

PROGRAM FOR NORMAL INSTITUTE

July 15, 16 and 17, 1913

THESDAY MORNING.

9:30. Called to order by Director T. B. Parker.

MEN'S MEETING.

- 9:30. A Short Description of the Soil Types of the State-J. L. Burgess, M. E. Sherwin.
- How Deep Should Land be Broken for Corn and Cotton-C. R. Hud-10:15. son, C. L. Newman. Discussion.
- How Early Should Corn and Cotton be Planted?-C. B. Williams, T. 11:00. B. Parker. Discussion.
- What is the Best Distance to Sow Rows of Corn and What is the 11:45. Best Spacing in Rows?-G. M. Garren. Discussion.
- 12:30. What is the Best Distance to Have Rows of Cotton and What is the Best Spacing in Rows?-T. D. McLean. Discussion. Adjourn until 2:00 p. m.

TUESDAY AFTERNOON.

- How Deep Should Corn and Cotton be Cultivated?-T. E. Browne. 2:00. Discussion.
- How Often and How Long Should Corn and Cotton be Cultivated?-2:45. J. L. Burgess. Discussion.
- 3:30. What Should be the Method of Cultivation of Corn and Cotton after a Wet Spell? Round Table. Discussion.
- Does it Pay to Make the Second and Third Application of Fertilizer 4:00. to Corn and Cotton? If so, When?—B. W. Kilgore. Discussion. What is the Most Economical Method of Harvesting Corn?—C. L.
- 4:45. Newman. Discussion.
- When and How Should Stable Manure be Applied?-Round Table. 5:15.

WEDNESDAY MORNING, JULY 16.

- When Should Land be Broken for Wheat and Other Small Grains?-9:00. M. J. Hendricks. Discussion.
- What are the Best Varieties of Small Grain for this State and Where 9:30.
- should we Obtain Them?—J. L. Burgess. Discussion. When and How to Sow Crimson Clover, Vetch and Rye in Growing 10:00. Crops for Winter Cover Crops-T. D. McLean. Discussion.
- At What Stage in Growth Should These Crops be Plowed Under for 10:45. Best Results? And Does Plowing Under Green Crops in Hot Weather Sour Land?-J. L. Burgess, C. B. Williams. Discussion.
- How Cheaply can Pork be Grown and What Crops Should be Planted 11:30. for Economical Pork Production?-D. T. Gray. Discussion.
- When Should Grasses be Cut for Dairy Cattle and When for Work 12:15. Stock to Obtain Best Feeding Value?—R. S. Curtis. Discussion.

WEDNESDAY AFTERNOON, JULY 16.

- What is the Best Method of Saving Peavine and Soy Bean Hay? 2:00.Round Table. Discussion.
- Is Silage a Safe and Economical Feed for Horses and How Many 2:30. Horses will Justify a Silo?-J. C. McNutt. Discussion.

- 3:00. The Sweet Potato: How to Grow and Harvest. Round Table.
- 3:30. Poultry on the Farm. What Breeds?—E. L. Green. Discussion.
- Construction of a Mangum Terrace and When Advisable-C. L. New-4:00.
- Fruit on the Farm. A Good Selection-J. C. Pillsbury. 4:30.
- 5:00. The Kitchen Vegetable Garden—Detjen.

THURSDAY MORNING, JULY 17.

- 9:00. Farm Management—J. M. Johnson.
- Coöperation: Different Forms and When Advisable-C. H. Poe, J. L. 10:00. Rives. Discussion.
- Dairying and Dairy Cattle-A. J. Reed, John Robinson. 10:45.
- The Silo and Its Use-W. H. Eaton. 11:30.
- 12:00. General Instruction to Lecturers-T. B. Parker.

WOMEN'S NORMAL INSTITUTE.

JULY 15, 16, 17, 1913.

PROGRAM-9:30 A. M.

The Qualifications of a Successful Institute Worker-Mrs. Henrietta W. Calvin.

The Country Woman and Her Relation to the Home and the Community-Mrs. W. R. Hollowell.

The Needs of the Country Woman-Round Table Discussion.

Lessons in Bread Making-Mrs. Chas. McKimmon.

Household Conveniences-Miss Caroline Phelps.

Demonstration, the Fireless Cooker—Mrs. H. W. Calvin.

Time-Saving Appliances-Miss Jessie White.

Demonstration, Biscuit Making-Miss Louise Mahler.

Economies in Cooking—Mrs. J. M. Whitted. Demonstrtaion, Coffee Making—Miss Phelps.

Training Farmers' Daughters to be Farmers' Wives-Mrs. R. W. Orr. The Relation of Parents to the Public Schools-Miss Linda Clement,

The Care and Training of Children-Miss Carrie Hudgins.

The Care of Infants-Mrs. W. R. Hollowell.

The Moral Training of Our Children-Mrs. R. W. Orr.

Physical and Moral Training of Children-Miss Linda Clements.

Rural Life as We Should Make it-Miss Jessie White.

Training the Child of Today for the Man or Woman of Tomorrow-Mrs. R. W. Orr.

Home Sanitation-Miss Katharine Parker.

Health on the Farm-Miss Linda Clement.

Subject to be Supplied-Miss Carpenter.

Subject to be Supplied-Miss Capps.

Judging Bread-Mrs. Calvin.

Judging School Lunches-Mrs. Calvin.

Women's Farm Life Convention-Mrs. Charles McKimmon, Chairman, Raleigh.

PROGRAM

OF THE

ELEVENTH ANNUAL STATE FARMERS' CONVENTION

AND

ROUND-UP INSTITUTE

PULLEN HALL

A. & M. College, West Raleigh, N. C.

August 26, 27 and 28

1913

OFFICERS.

President—S. H. HOBBS, Clinton.
Secretary—T. E. BROWNE, West Raleigh.

PROGRAM.

TUESDAY, AUGUST 26.—Soil DAY.

- 10:30 A. M.—Greetings—President D. H. Hill and Commissioner W. A. Graham.
 - Soil Work in the State—By Director B. W. Kilgore, Raleigh, N. C.
 - Do Soils Wear Out?—Prof. C. L. Newman, A. & M. College. How I am Saving Labor by Tillage Implements—W. D. Boseman, Rocky Mount, N. C.
 - Results of Late Applications of Commercial Fertilizers—By C. B. Williams, North Carolina Experiment Station. Dinner.
 - 2 P. M.-Address-C. W. Spruill, President of the Convention.
- 2:30 P. M.—Demonstration of Constructing the Mangum Terrace—By P. H. Mangum, Wake Forest, N. C.
 - 3 P. M.—Demonstration in Laying Out, Digging and Placing of Farm Tile—H. M. Lynde, U. S. Department of Agriculture, and Prof. M. E. Sherwin, A. & M. College.
- 7:30 P. M.—Essential Principles of Coöperation—Dean H. C. Price, State University, Columbus, Ohio.
 - Marketing Cotton—By C. J. Brand, U. S. Department of Agriculture.
 - Coöperation in Marketing Fruit Crops—By J. F. Fooshe, *Progressive Farmer*, Raleigh, N. C.
 - Cooperation in Live Stock and in Dairy Products—By A. O. Nelson, Svea, Minn.

WEDNESDAY, AUGUST 27.—LIVE STOCK DAY.

- 5 A. M.—Trip over College and Station Farms.
- 7:45 A. M.—Judging Farm Mules—By Prof. J. C. McNutt, A. & M. College.
- 8:15 A. M.—Judging Draft Horses—By Schuyler Salisbury, A. & M. College.
- 8:45 A. M.-Judging Hogs-By Dan T. Gray, N. C. Experiment Station.
- 9:30 A. M.—Silage for Beef Cattle—By W. F. Ward, U. S. Department of Agriculture.
- 10:15 A. M.—Development of a Profitable Dairy Herd—By Alvin J. Reed, U. S. Department of Agriculture.
 - 11 A. M.—Southern Markets for Beef Cattle and Sheep—By R. S. Curtis, N. C. Experiment Station.
- 11:45 A. M.—Demonstration of Methods of Injecting Hog Cholera Serum— By Dr. B. B. Flowe, State Department of Agriculture.
- 12:30 P. M.—Demonstration in the Recognition of Tuberculosis in Cattle— By Dr. G. A. Roberts, A. & M. College. Dinner.
 - 2 P. M.—Public Sale of Berkshires, Poland Chinas and Duroc-Jerseys, held under the management of the North Carolina Swine Breeders' Association.
- 7:30 P. M.—A Message from the Sand Hills—By Hon. Henry A. Page, Aberdeen, N. C.
- 8:30 P. M.—Address—By Hon. A. F. Lever, Chairman Committee on Agriculture, House of Representatives, Washington, D. C.

THURSDAY, AUGUST 28.

- 7:30 A. M.—Practical Demonstration of the Principal Stages in the Production of Peaches and Apples: 1. Methods of "Laying Off" the Orchard......Mr. Detjen
 - 2. Planting the Tree, and Its First Pruning....Mr. STODDARD 3. Training the Tree......PROF. PILLSBURY
 - 4. Methods of Cultivation and Implements......Prof. Hutt

 - 6. Preparation of Bordeaux Mixture......Prof. Fulton
 - 7. Preparation of Lime-Sulphur Solutions....PROF. SHERMAN 8. Spraying the Trees........MESSRS. HILL AND KLEIN
- 9. Picking and Packing the Fruit......Mr. SHAW 9:30 A. M.—This Farm Pays: That One Does Not. Why?—By J. M. Johnson, U. S. Department of Agriculture.
- 10:15 A. M.—How to Prevent Cottonseed Meal from Poisoning Hogs—By Prof. W. A. Withers, A. & M. College.
 - 11 A. M.—Business Meeting.

Election of Officers. Reports of Committees.

PROGRAM HOUSEWIVES' CONVENTION.

At Raleigh High School Building.

MRS. CHARLES McKimmon, Chairman. MISS JANE WARD, Secretary.

The Housewives' Convention is designed to bring housekeepers together for discussion of better methods of living; how best to make the household expenditures, how to market, to cook, to sew, to care for children, and to improve home conditions generally.

Every woman in North Carolina is invited to come, and Dr. Hill, President of the A. and M. College, offers the College Dormitories free to any

one wishing to come.

If this offer is to be taken advantage of, sheets, towels and pillow cases should be brought. Meals may be secured at the College at twenty-five cents each.

Tuesday, August 26.—10 A. M. to 2 P. M.

(Commissioner of Agriculture.)

The Object of the Convention......Mrs. McKimmon, Chairman The Power of the Organized Housewife......MRS. JULIAN HEATH (Of N. Y., Founder Housewives League of America.)

Talk on Appetizing Ways of Cooking Meats, with a Demonstration—

Miss Emily G. Bossong (of New York)

Talk on Kitchen and Household Conveniences. Demonstration Fireless Cooker.

Discussion.

Wednesday, August 27.—10 A. M. to 2 P. M.

TalkT. B. PARKER (Director Farmers Institutes.)

Lesson in Bread Making. Anyone invited to join. Please bring

Talk on Batter Breads, with Demonstration in Making Queen of

Demonstration of Canning in Tin for the Market-

ALAMANCE COUNTY TEAM OF TOMATO CLUB GIRLS Talk on Soups, with Demonstration......Miss Bossong

THURSDAY, AUGUST 28.—10 A. M. TO 2 P. M.

Lessons in Bread MakingMrs. McKimmon
TalkD. H. Hill
(President A. & M. College.)
Talk on Salads, with DemonstrationMiss Bossons
Cooperation of Women from Town and Country
The Care of the Child
Fireless Cooker Demonstration.
Discussion.

Some Things I Have Found Helpful in My Own Home.

MRS. HENRY SLAGLE.

As the demands of life are much the same with all of us, necessarily our needs are much the same. I have been a home-keeper for more than twenty-five years and have made it a close study, trying to find the best and easiest way of doing things, and I have much to learn yet. I am always glad to get any new ideas or suggestions from my coworkers, so I will tell first of the arrangement of my kitchen. As I got some of my best ideas from some of our institute workers, I would like to pass them on; someone else

might be as glad to get them as I was.

My kitchen is small, 12 by 15 feet. I like to get things as near together as On the west side I have a door with water running right to it. Just outside I have a sink to carry off the waste water. There are two large windows right together which give plenty of light for my range that sits right under them. It is a Queen Kalamazoo range and it cost only \$36.67 delivered at Franklin. A cousin bought a range very much like mine from an agent, and she gave \$75 for hers. We farmer folks do give lots of our money to traveling agents. In this case she gave a little more than twice as much for her stove, and it was not any better than mine. Above the two windows I have an air-shaft as near the overhead ceiling as possible, 25 inches long and 6 inches wide, for an escape for hot air and smoke and fumes. I like it very much, for so often something boils over or something drops on the stove when it is hot and the whole house is filled with smoke; but this opening carries it all off. In the heat of summer the air never gets stuffy. I made a shutter to close in very cold weather, with hinges put on so the door will drop down; then I can close it with a broom handle or a stick of stove wood. I put a piece of wire screen on the outside to keep flies out. Behind my range I have a space three feet between it and the dining room, and on this wall I have a drop shelf fastened to the wall with strap hinges and a strong brace in the middle fastened to the shelf with another strap hinge. The shelf just drops down against the wall and is entirely out of the way until I want to use it, when I lift it up and set the brace on a little block of wood which has been nailed on the wall to support it. This I find very convenient for raising lightbread and for many other purposes. The dining-room door has swinging hinges, so in going to and from the dining-room with both hands full all I have to do is to walk against the door and it will swing open either

I also have a large deep cupboard built in the corner right behind where this door opens and just opposite my range. In making one of these get a good workman and then it will always be satisfactory. It is not always the things we get for the least money that prove to be most economical. I got a good carpenter and he made the frame or face of this cupboard of oak that would take a nice finish. He put in a set of slides 3 feet and 3 inches above the floor for two nice deep drawers. One of these I use for all my kitchen trinkets, such as spoons, egg-beaters, broilers, etc., and the other for a meat drawer. I can put a whole ham in it and my meat for seasoning. Nice brass rings for the drawers cost 20 cents. Below the drawers are two doors opening into the lower part where I keep all my pots, pans, muffin rings, etc., and

above are two much longer doors, opening into a number of shelves, where I keep various things, dishes for taking up meals, tea, coffee, spices, starch, soap, and a great many other things, so that I don't have anything hanging on the walls except dish pans; everything is away from dust and flies. Just to the left of this and right up against it is a rather large table on castors that I can move into the middle of the room or before the door to work when it is hot. This table also contains a large drawer for kitchen towels. There is also the meal chest, containing three apartments, each having a separate lid. It stands just 31 inches high. I had it made to suit my height for kneading bread. The chest itself is 15 inches above the floor, the end pieces being cut out of broad plank and shaped to serve as legs.

Then the fireless cooker, last but by no means the least, is a *luxury*. After using one we don't want to do without it; it is so helpful, convenient, and such a comfort. When you want to go to church or anywhere in the morning, just put your dinner in the cooker and there is no danger of its burning, no fires to keep up, and when you get home you have a hot dinner ready to serve. I don't think there is any other way of cooking meats to make them so good. Your roast beef, mutton chops, broiled chicken or anything else is

better cooked in the fireless cooker than in any other way.

A sink in the kitchen saves so many steps even if there is no running water in the house; it will save time and opening doors when it is cold. There are many other little conveniences and ways of making work easier that every woman might have if she would study her situation and make the most of her opportunities. She should be an equal partner with her husband in sharing things, good or bad, and if they are able to have improve-

ments on the farm they ought to have them in the house too.

Another important thing my long experience as a mother and housekeeper has taught me is the need of being ready for any emergency. Keep all kinds of medicines and remedies on hand and learn how to use them. train ourselves to be dependent or independent as we will. I have raised eight children and Providence has been kind, but if I should tell you how few calls we have had for a doctor you would not believe that I am as great a friend to them as I am. We have called a physician to visit our children in only three cases. We have never lost one, and they are all strong and well now. Of course they have had many little accidents. The worst was with our second son. He was working in the blacksmith shop and had a piece of red-hot iron in the tongs, and when he struck it with the hammer it flew out of the tongs and struck him on the eye, cutting through the lid, and made a slight cut on the ball one-half inch long, not quite reaching the sight. He came to the house with his dirty hand over it and said, "Mother, I have ruined my eye." I looked at it and it did look like it might be ruined sure enough, with the blood running down on his cheek through the smut and dirt off of his hand. But I ran to one of my emergency bottles and got a tablet of bichloride of mercury and put one quart of warm water on it in a basin. Then I got a large clean cloth and swabbed his eye and face off, and for fear I had not gotten it entirely clean I made another solution exactly like the first and went over it again. Next I got a bottle of borax water that I kept for burns and sore throats and wet a good big piece of absorbent cotton and put it on his eye and bound it up. Then I went to the telephone and called the doctor, and as he had just had a call above our home he said he would be along in a little while and bring me a dressing. When I told him what I had done for it, he said I did not need anything else, but I used the borated vaseline that he brought and in one week the eye was ready for the bandage to be taken off, and it never did inflame one particle. The time to save trouble is in the beginning. Always disinfect a hurt, even a small one, right at first. I like to keep a little bag of sterile cloths for binding up wounds, and this is the way I sterilize them. Put one bichloride tablet in one quart of water in a porcelain vessel and then put the cloths in it and boil them. Then dry in the sun and wrap them up carefully in another cloth and they are ready for use. When your little boy sticks a rusty nail in his foot, put some kind of a disinfectant as quickly as possible into a basin of water just as hot as the child can stand and have him keep it there fifteen minutes anyway. If you don't have bichloride of mercury or carbolic acid or some other good one, put one teaspoonful of copperas into the water; then take out of the water and dry off and drop turpentine into the place as long as it will absorb any and bind it up. It will never give you any trouble. Have your bottle of iodine to paint behind the baby's ear when he takes earache. A few drops of warm water and glycerine in the ear is good. One-half teaspoonful of borax to one glass of water used as a gargle in sore throat always relieves. Add to a five-cent bottle of vaseline one teaspoonful of powdered borax for a dressing for burns. One teaspoonful of boracic acid (this is the refined borax) added to one-half pint of water and brought to a boil (then cooled and bottled) is one of the best eye washes at all. It will relieve any burning or soreness of the eyes. This should always be used in an infant's eyes at birth and every morning until the child is a few weeks old. Many make a weak solution of this and swab out the mouth every morning to prevent thrush.

NOTE BY T. B. PARKER.—Bichloride of mercury is a valuable family medicine; it is also a deadly poison and should be treated as such by keeping it and all other poisons under lock and key where children can not get to them.

Every poison should be labeled as such and have its name in big letters so you may know just what it is, and kept entirely away from the ordinary household remedies, so as to prevent mistakes that may cause death.

Within the last year we have heard of several instances of bichloride of mercury being taken for headache tablets, through mistake, with fatal results. We can not be too careful about poisons. Great sorrow and affliction have come to many families on account of carelessness in this respect. Either lock them up or throw them away where they can do no harm. It will be well to have posted in a conspicuous place where poisons are kept a notice like this (written by Dr. Harvey W. Wiley) (which I have copied from the December number of *Good Housekeeping*):

FIRST AID IN POISONING.

Paste this in your medicine chest. Number your poison bottles to correspond to the numbers given here; then you can tell at a glance what anti-dote to give or take.

1. Arsenic (Fowler's solution, Arsenic Trioxid, Cuprous Arsenite).

- 2. ACETANILID AND PHENACETIN (nearly all headache remedies).
- 3. Ammonia or Caustic Potash or Soda.
- 1. Give a tablespoonful of mustard and salt in a glass of warm water, or thirty grains of zinc sulphate, or evacuate the stomach with a pump. Afterward give one tablespoonful of ferric hydrate every fifteen minutes, or same quantity of dialyzed iron. Apply external heat and stimulants.
- Symptoms, cyanosis (blue lips), weak pulse, sweating. Lower head; apply heat to body; if stimulants are required, give whiskey, strychnin, or belladonna, and oxygen inhalations.
- Give dilute acid (lemon juice in water or vinegar). Afterward plenty of milk and eggs or olive oil.

- 4. BICHLORIDE OF MERCURY.
- 5. BELLADONNA OR ATROPIN.
- 6. CARBOLIC ACID (Phenol).
- 7. CHLORAL AND CHLOROFORM,
- 8. COCAINE.
- 9 IODIN.
- 10. Morphine, Sulphate, Opium, and Paregoric.
- 11. Mineral Acids.
- 12. Phosphorous.
- 13. STRYCHNINE.
- 14. ILLUMINATING GAS.

- 4. Give a tablespoonful of mustard and salt in a glass of warm water, or thirty grains of zinc sulphate. Afterwards milk and eggs. If in collapse, use heat and stimulants.
- Give a tablespoonful of mustard and salt in warm water. After vomiting, one-quarter grain of morphin sulphate. Stimulants if required.
- 6. Flour and water; use stomach pump or give one ounce of Epsom salts, or two to four ounces of whiskey or slightly diluted alcohol. If in collapse, add heat to body.
- External heat, keep head low, use stomach pump or give emetic of half an ounce of mustard and salt in warm water. Friction to body. Hot black coffee.
- 8. Stimulants: Nitrate of Amyl, brandy or aromatic spirits of ammonia. Black coffee, external friction.
- 9. Starch made into drafts with cold water. Stomach pump or tablespoonful of mustard in a glass of water.
- 10 Stomach pump or tablespoonful of mustard and salt or grease in warm water. Potassium permanganate, ten grains in glass of water. Black coffee. Keep patient awake. Supply heat. If stimulation is required, use atropin or strychnin.
 - 11 Stomach pump, alkalies, as magnesium carbonate or baking soda, also milk, sweet oil or eggs. Heat or stimulants, if rerequired.
 - 1.3 Stomach pump, or three grains of copper sulphate in water every fifteen minutes until vomiting is induced, or thirty drops of oil of turpentine every quarter hour for four doses. Give purge. Avoid fats and oils.
 - 13. Stomach pump or a tablespoonful of mustard and salt in warm water. Keep patient quiet. Seven to ten grains of tannic acid. For convulsions use chloral or chloroform. Inhale amyl nitrate.
 - 14. Remove patient to fresh air. Give oxygen to inhale. Use pulmotor or some form of artificial respiration. Supply warmth to extremities.

Good Housekeeping ought to do as much as possible to put an end to these unfortunate fatalities. First of all, segregate all poisonous drugs in the household, as advised before. Second, study some simple remedies which may be applied in case of poisoning by the common poisons until medical attendance can be secured. To this end a page has been prepared of some common poisons, with a few of their simple antidotes. The readers of Good Housekeeping magazine are requested to cut this page out and paste it plainly in every closet or cupboard in which deadly drugs are kept. Not only should each reader do this, but the remedies and antidotes should be clearly kept in memory.

STOMACH PUMPS AND ANTIDOTES.

As a rule the first thing to do when a poisonous dose has been swallowed is to empty the stomach. A stomach pump does not cost very much, and its operation is extremely simple. Every family should be provided with one, or else make sure that one is easily accessible in the immediate neighborhood. A stomach pump is to be preferred to the ordinary emetics. It may not, however, always be possible to secure one. For this reason it is advised that a

few household emetics be kept on hand.

A spoonful of powdered mustard to which a considerable quantity of common salt has been added, suspended in warm water, makes a very effectual and reasonably prompt emetic. In fact, emesis as a rule can be easily and promptly secured by drinking copious drafts of lukewarm water, almost saturated with salt. The mustard, however, renders the emesis still more prompt. This simple method of producing emesis is to be preferred to the use of sulphate of zinc or other mineral emetics. The mineral emetics are, however, very prompt and are easily kept on hand, zinc sulphate being the one usually recommended. Epecac can be easily kept and is also efficient. Thus it is seen that the first step in case of poisoning is to evacuate the stomach, preferably by mechanical means, otherwise by emetics which are easily kept in every household.

After this, the proper antidotes are to be administered. It would be a wise plan for the housekeeper to keep on hand some of these common antidotes. For instance, arsenic poisoning is very common, and the best antidote for arsenic poisoning is hydrate of iron, that is, an iron salt precipitated with ammonia. The efficiency of this remedy, however, largely depends upon its freshness. It therefore can not be kept ready, and in lieu thereof the housekeeper should have the simple ingredients for making it. Two bottles, one holding a solution of ferric sulphate and the other magnesium oxid, suspended in water, are easily kept, and can be prepared by the druggist of such strength that, when mixed, the ferric hydrate is completely precipitated. When these two solutions are mixed together and thoroughly shaken, they are ready at once for administration in arsenic poisoning, and if promptly used would save many lives. This mixture of iron hydrate should be given in large doses and frequently repeated.

Vinegar, which is a splendid antidote for caustic potash and ammonia, is always available. The best stimulants, as a rule, are whiskey, and, in some cases, caffein or hot coffee. It is not advisable to keep on hand such stimulants as strychnin or chloral or chloroform, which are themselves poisons. They can, however, be promptly secured at any neighboring drug store,

though perhaps no more quickly than a physician could be called.

THE NEED FOR CARE.

Families are, of course, not expected to keep in stock apparatus for the inhaling of oxygen, or to be possessors of a pulmotor. It is the part of wisdom, however, for every one to know where such an apparatus can be obtained for these purposes, so that in case of asphyxiation or other paralysis of the nerves and muscles which control respiration artificial breathing can be set up. This is particularly true in those numerous cases of poisonings due to the inhalation of illuminating gas.

Let every household into which *Good Housekeeping* goes have all of these poisons segregated and properly marked. Have the list of poisons and their simple antidotes pasted in plain view, and know where an oxygen inhaler and pulmotor can be secured promptly in case of emergency. By these wise precautions many lives may be saved.

The Country Home.

MISS CARRIE HUDGINS.

The word home carries with it music and melody if it is a home in the finer sense. Houses on every hand are waiting to be made into homes, and it is the woman in the home who makes it what it is; so let us be up and doing.

A casual glance at the home and refinement and cleanliness should be our first and lasting impression. No work requires more system and order than the home, to accomplish the desired end; many steps are wasted because no specific plans are made. Eliminate from the home the useless bric-a-brac of years ago. They are no good and mean lots of work if they are kept clean, for they are great dust-catchers.

Floors are one of the greatest problems of housekeeping and rightly so, if there is a large family to look after and scouring to be done once or twice a week. Stained floors with a top dressing of floor oil seems to be the cheapest and most satisfactory floor dressing. A floor oiled once or twice a year will

protect the stain and keep down the dust.

How the whole family dread spring cleaning. Let's try to do this work in a more systematic way; not have the whole house torn up for a week, and everything out of its place. A better plan is to clean one room at the time, and put it in order before attempting another. Carpets should be taken up,

well cleaned and aired before replacing.

In buying furniture care should be taken, for the appearance of the room and the amount of labor required to keep it in order depend much on the selection. Plain furniture is much prettier and more easily kept than the many scrolled designs. The parlor in many homes is the most uncomfortable room in it; especially so if it is one of the closed up kind, where fresh air and sunshine are rarely permitted. Don't be afraid of sunshine and air even if they do fade the carpet and wall paper. It is one of God's greatest blessings to us; so let it in.

Look out for an air of comfort for the living room; here is where the family come together for rest and recreation, and if it is not found here it will be sought at other places. The children obtain their lasting impressions of the home and begin to lay plans for another home perhaps in the far

future.

The yard requires taste and skill as much so as the inner furnishings of the house. Every yard can't have a beautiful lawn laid off symmetrically with the shrubbery clumped here and there; however, every one can be clean with no rubbish around; flowers may adorn it with little or no expense.

In the country home is found the opportunity for children to be trained in every line of home-making. After all, the most attractive part of the home

is the family who live in it.

The children, as Cornelius once said, are the most precious jewels, and in them lie the possibilities of mankind. Not for one moment can we afford to neglect this training for anything else. Just how old the child should be when this training should begin depends on the child. Few of us begin early enough. When the little one climbs up in the chair and wants to help wash dishes, or insists on sweeping the floor, often we are tempted to say, "Run along, you will break the dishes, or make more trash than you clean up." Right there the mistake is made, for if we continue to push them off they will cease to come and offer a helping hand, but will be content to go along and let mother do the work.

How proud mothers are of their domestic girls, and fathers of their sons

who love the home and are willing to stay on the farm! And justly so. Our boys and girls should feel that they are a part of the home early in life, with

some specific duty to perform each day.

To me one of the greatest responsibilities of child-training is their intense desire to do as wc do and not as we say do. An instructor on one occasion was making a bed for a little one, charging her to imitate her the next morning and be very careful and not leave one thing undone. By accident, one of the pillows was knocked out of the window, where it had been placed while the bed was being made. On the following morning the little one showed she had grasped many of the instructor's suggestions, and with a few aids here and there the bed was ready for the pillows. She went to the window and deliberately knocked one out saying, "You thought you'd catch me, but you see I remembered you knocked yours out and I've done it too." This is often the case: we are imitated in the wrong place; so it behooves us to always be on the alert.

Some one has said housekeepers are born, not made. While we know this is not always true, we realize every day that to make our daughters proficient requires time and patience. Often a careless boy or girl will awake by watching nature; interest the children in growing flowers. They will relieve you and it will be such a pleasure to them to know they are doing something to-

ward beautifying the home.

The country home where love and contentment reign is one to be envied, the home that belongs to the whole family, each one trying to make it a perfect one, each one looking after the comfort and pleasure of the other.

The country school teacher can plant many seed in the young mind that will be carried home. Interest the children in beautifying the schoolhouse and grounds, and soon you will see the fruit of your labors developing in the homes.

Pin Money Possibilities on the Farm.

MISS LINDA CLEMENT.

The chiefest source of a woman's farm revenue has always been her eggs, chickens and butter. One is almost justifiable in believing that a man who will carry to market, dispose of and pocket the price, provided his wife's labor was expended in the production of these articles, is nothing short of a — At any rate, the average farmer isn't guilty—there are few grafters in the profession, and almost to a man they consider it a privilege to make possible an earning capacity for wife and daughter. If they are progressive farmers, nothing short of the best material finds a lodging place on their farms, and if the women are going in for fowl culture nothing save a

thoroughbred flock shall mark the beginning.

A venture in poultry designates chickens as the original flock. The disposition one intends to make of them would influence the selecting of a breed. If you wish to grow broilers or friers, you want a heavy, fat chicken which grows off rapidly; if you wish to gain your profit from eggs, you would choose one of the slender-bodied laying strains. A reputable poultry journal is a very necessary part of the outfit, and an eye alert to market demands must supplement all other information gained. Keep an accurate account of expenditures for first year and do not invest in expensive equipment nor add too large a flock of turkeys, guineas or ducks until your experience with your small flock of chickens shows your selling price tallying or indicating a margin above cost of production. Too many poultry plungers fail because their original investments in tremendous flocks and costly furnishings haven't the stability and insurance of past experience to make them profitably go. After your small return has produced a result, you are in need of a consumer. Never sell through a commission firm; you are entitled to the entire profits. Develop your business capacity by hunting your own markets, and once found, make them regular customers by furnishing only extra select stock. Let them learn they can depend on you for promptness and straight

dealing. Hotels and colleges hold yearly contracts with farm individuals for poultry, butter and eggs. If they demand two-pound chickens, assort yours and send them only two-pounders: if white eggs are their choice, send them only white ones and reserve your tans and creams for another market. In the commercial world, we are told, the distinguishing mark of an American is that "he wants what he wants when he wants it," and he is willing to pay the price of his whims and impatience. So never argue with a customer that he wants something else, but cater to his eccentricities and restlessness since he doesn't count the cost.

In marketing your eggs, pack in cartons bearing your name and trademark and build your reputation on that trademark. Never sell an egg that has been gathered longer than three days; do not market your dirty eggs,

rots, spots or dwarfs.

Increase yearly with your profits your flock of birds. Keep those that are especially strong and have bred true to color, size and other favorable requirements. Adaptability of breed for purpose desired would also influence the person's selection of a cow, when considering the possibility of profitable returns from the milk or butter industry. Just any old cow is not a dairy cow. Select a Jersey, Holstein or any standard strain of butter or milk producer. Begin at the beginning—to use a hackneyed expression—and learn the business from the inside out and from the outside in. Send for a government bulletin or attend a four or five days government dairying demonstration taking place in your town or the neighboring. Learn the nutritive value of the foods you feed your cows and learn to keep a record of and make tests of your milk. Follow minutely government formula for perfect butter, and produce a creamery variety which the year round nets you thirty-five cents a pound instead of the poorer product which retails at ten or fifteen cents. Remember there is no profitable return in money value in producing an inferior grade of anything.

The tomato clubs that have recently been organized in nearly all parts of the State, with a desire and hope of increasing the "Pin Money Possibilities" on the farm, may prove delusive unless the strictest regard is given to the instructions sent out by those who are in charge of this work. The best of tomatoes, the best methods of putting them up and absolute cleanliness should be strictly adhered to. If these essentials are disregarded the country may be threatened to become glutted with canned goods that the trade nor the consumer will want. If on account of this off-grade stuff the prices should drop to 60 or 75 cents per dozen, which is not improbable, the business could not be considered at all remunerative. It would pay far better to not can tomatoes at all, or only enough for home consumption, than to put them up at a loss. The farm woman finds sufficient for her hands to do without unprofitable or superfluous labor. But the woman on the farm who puts up only good stock and receives one dollar and twenty cents per dozen for her entire canned output is declaring a dividend, and she'll declare a still larger if she's a human market barometer. She'll grow two crops of tomatoes, and like some of our big peach, apricot and cherry producers, her canning outfit will be insurance for that part of the crop which fails a raw market. A store tomato, the standard canning variety, is a midsummer ripener and can not be successfully forced for an extremely early market. From my own personal experience I prefer a Langdon Earliana, a variety which has been on the market six or seven years. My Langdons, under conditions both favorable and unfavorable, have ripened from one week to ten days earlier than the standard earlies, and were ready for market when Florida tomatoes were still bringing fifty cents a basket.

To one interested in a canned goods market, a variety of fruits and vegetables rather than a dependence on just one, as the tomatoes, means more in profitable returns and finds readier sales. Of the vegetables maturing within the season in which planted, the English green pea, when properly canned, brings the most substantial price, ranging from \$1.60 to \$2 per dozen. Canned asparagus holds a market, at a price above other vegetables, and on a par

with most of the California fruits. It requires three summers for an asparagus bed to reach maturity if grown from seeds. Still, when one considers that when once established it lasts indefinitely, the cultivation and patient waiting is worth the while. All asparagus for canning should be bleached and all stalks should be of a uniform size and length. If your canned product meets all market requirements, you should receive from \$2.50 to \$3 per dozen for your asparagus. Select varieties of peach, apricot, pears and berries commanding a good market at high prices, home-canned goods do not have to compete with canning factories, for they are always preferable and command, therefore, a better price. But, remember, just any old stuff you sling together doesn't find a waiting market. Grade everything you sell; use only perfect fruits and vegetables either for the raw market or cans. Build your reputation on perfection of flavor, cleanliness and honest weight. Specialize, if you care to, on some one fruit or vegetable, but be sure it's one the market isn't easily satiated with-fig preserves, sweet pickled fligs, sweet pickled cantaloupes or peaches-something of this kind.

A Virginia woman built a factory from a tiny kitchen, and a fortune from a paltry investment, not only because by intuition she discerned that "Pin Money Pickles" would tickle the palate of a nation, but because every pickle she afterwards produced partook in size, flavor and perfection of that first delectable. Reputations are sometimes acquired by accident, but it's another thing to live up to them, and the rule holds good in a commercial sense.

In the profitable realm of the vegetable world there are waiting opportunities with the expenditure of a few cents for seeds, good earnest labor for cultivation, hard common sense for markets, and the farm woman need be no beggar. Earning one's spending money gives woman a confidence and added respect in and for her own capabilities. There are each day avenues multitudinous opening for the feminine farmer who would and will earn her way. There are bee farms, flower beds, early transplanted plants, lettuce farms, and home-made dainties galore. The "bide at home" woman has proven her capacity, and her profession will continue to grow.

It Pays to Think.

LUCIE T. WEBB.

The thinking farmer is the one who is making good today. It is he who considers the effect of every lick; who studies his soil and by the use of modern methods, with an equal amount of labor, increases the yield from two to fourfold. It is the thinking woman who accomplishes in one day by thought and system what her neighbor does in two. Yet how few of our women think. They go into the day's work with an indistinct idea of the myriads of things to be done, jumbled together, with no plan, no outline in the mind's eye; no grouping of tasks so that two and three things may be done at the same time; no regard for short cuts and easy ways; and, most of all, with no consideration whatever for their own strength and physical endurance. They stand through countless opportunities to sit and rest the tired feet. They trot from one place to another in an aimless way, making many trips where one should answer. All because they do not think.

A woman's life on the farm at its best is hard; how hard no one but the one who has lived it without hired help knows. Much of the drudgery can not be eliminated, even by a world of system. There are meals to cook, dishes to wash, beds to make, floors to sweep, milk to churn, vegetables to gather, fruit to save, water to bring, and sometimes, I am sorry to say, wood to cut, pigs to feed, and cows to milk. This is hardly a beginning of the daily tasks that confront her; and when there are babies to care for I often wonder that she is alive to tell the story. Surely then, if there is any help to be had in thinking, the farm woman needs to think. Else she can not greet her tired husband when night comes with a well-kept home, good food, and, best of all, a cheery smile.

Conditions are different in every home, therefore the woman herself must study these conditions and solve her own problems the best she can. Let her have ever before her the one thought—save steps. Children are great step-savers for mother; the exercise and training is good for them. Not hard work for the little ones, but they enjoy seeing "who can pick up mamma's thread first," or "who can bring a spoon from the dining-room the quickest." A large waiter is also a great help, almost an entire meal can be carried to the table at one trip, or all of the dishes brought in from the dining-room when ordinarily one goes back and forth a number of times. Take the waiter to the pantry and while resting a minute on the meat box make a calculation of all the things needed in preparing the meal and, piling them on the waiter, carry them all to the kitchen at one time. Now rest again, this time in the kitchen rocking chair, and calculate how many steps you have saved. A small table can be placed close to the kitchen stove on the left-hand side and on it kept a jar of lard, some sugar, salt, pepper, a knife, fork, spoon, stove-lifter, etc.; this keeps one from going back and forth across the room to the kitchen table. Again, a wheelbarrow may be used to advantage in hauling stove-wood, one trip bringing enough to last a whole day. Or taken to the garden for vegetables, often this saves a half-dozen journeys. By all means, have the garden near the back of the house. I know I have, in days gone by, walked hundreds of miles to a garden off from the house out of reach of the chickens.

There are other ways, at a small expense, the housewife may save herself an untold amount of labor. A kitchen sink at a cost of from three to five dollars will be worth its weight in gold. A fireless cooker, an oil stove, linoleum on the kitchen floor, and where it can be done, a convenient water supply could be had in most of our homes if the housewife started in with

the determination to have them.

As a parting word let me say, save your feet. Every woman will say her feet are more tired than anywhere else when night comes. Then she should sit down and work whenever it is possible; and in the winter, if the kitchen stove is the only chance to warm them, put a warm brick under each foot as she peals the potatoes, wipes the dishes, or picks the chicken.

Factors That Will Enter Largely Into the Betterment of North Carolina Agriculture.

A. L. FRENCH.

Every thinking citizen of North Carolina realizes the importance of our premier industry—agriculture. From the west line of Cherokee County to where the waters of Old Ocean beat upon the thin strip of land at the lower end of Currituck, that divide them from those of Albemarle Sound, men and women are found busily engaged in winning a living, and something for a rainy day, from the soil.

These men and women are our leading citizens; for they are engaged in the most important industry of ours, or any other State. And the young men and women that are, in the next generation, to take up and carry on the work of their fathers and mothers on the land are the most important factors that will enter into the betterment of the State's agriculture.

How important then that the training of these young lives be along lines that will enable them to dignify the work of their fathers and improve upon

it to the degree that the increase of the world's population demands.

This training the writer believes should be the work first of the fathers and mothers on the farm. They should be trained from their infancy in the need for a better care of the soil and its more economical handling. Then as they arrive at school age the State should, while training them to develop their minds, strive to keep ever before them the principles that their parents have planted and tended before they were given into the State's keeping.

This means an agricultural education for every boy and girl that is raised upon the farms of the State; an education, by the way, that unfits them in no way for any other business that they may choose to take up later; for a brain training founded upon the great principles that pertain to the soil will be one of the best foundations upon which to rear an educational structure that will fit for any other business or profession. And the hope of the country as I see it is to make of farm boys and girls farmers first, then let the surplus go to other callings; for the greatest need of our State today is better farmers. The greatest work that lies at the door of these better farmers of the future is the improvement of the soils of our State; for it is a fact that while our gross income from the lands of the State amounts to vast sums yearly, yet not half of the acres upon which our products are produced-because of a depleted condition-pay a living wage to the men handling them. This can mean nothing else than poverty to the farming people. And a people continuing in poverty generation after generation lose courage and ambition, and a consequent lowering of their standard of living and citizenship is inevitable.

This condition among those responsible for the care of our greatest industry can never be tolerated. Our new farmers must study and experiment until they learn how-by better drainage, better tillage, better fertilization, more economical working, and a better handling of necessary capital-to put these border acres into the profit-giving column; make them produce a greater yield each year at no greater expense, and cause them to increase from year to year in natural stored-up fertility. And then will the present generation be more economically fed and clothed and the heritage of future generations be conserved.

These young men and women of the future must be brought to realize clearly that upon them rests very largely the conservation of our great natural resource called water-power; for while the State and nation in the coming years may spend vast sums of the people's money in reforesting the mountains and building great reservoirs for the control of surplus water, yet upon them—the men and women having the control of the farming lands of the State—must fall the great bulk of the work of regulating the flow of surplus water.

The farming lands of the State must be so thoroughly underdrained, so well broken, so completely filled with vegetable matter, and the rougher portions of the farms so constantly covered with grass that surplus water willthe greater part of it—be made to seep through the land and thus leave gradually, rather than to rush off the surface of the soil to swell the creeks

and rivers to the bursting point.

Upon the farmers and their wives of the future will fall in a large degree the work of beautifying our State, cultivating her natural resources, for beauty that is second to no State in the Union. Our unsightly patches of cultivated lands must be broadened and lengthened until they meet, forming groad areas of well-tilled fields. Our unprofitable brush-grown gullies and galled hills must be made to lend beauty to the landscape by presenting an unbroken expanse of rich green, profit-giving grass. And upon these pastures the unlovely scrub animal must give place to the man-moulded, beautiful, well-bred cow, horse, sheep, and hog.

The farm homes of these future farmers will reflect their culture and prosperity, and the open country from Currituck to Cherokee will give abundant evidence that our State has recognized the importance of her greatest natural resource—the soil—and has given thought to the training of the people in the land; has given to agriculture the dignity that its importance

warrants.

Variations in High Yielding Varieties of Cotton.

JAMES M. GRAY.

In this report the records for the year of 1903 and 1909, inclusive, of the North Carolina Test Farms have been used. Most of the information is from the Iredell and Edgecombe farms, but the records from the Red Springs farm were used for the three years this farm was in operation (1903-1905).

In the experiments, from which the data for this report were gathered, the fertilizers used were the same on each farm. A $7-2\frac{1}{2}-2\frac{1}{2}$ formula was used practically all the way through the series. The preparation of the land and the subsequent cultivation was the same in each instance. The land was broken with a two-horse plow eight to ten inches deep early in the spring and harrowed just before planting. The cultivation was frequent and shallow.

On the Edgecombe farm the land is a Norfolk Sandy Loam, varying in depth from 6 to 24 inches, with an average depth of about 12 inches. This soil holds manure fairly well and gives a yield of about a bale and a quarter of cotton without heavy fertilization. The seasons are of good length for the maturing of cotton.

The lands of the Red Springs farm are similar to those of the Edgecombe farm, Norfolk Sandy Loam, but less fertile naturally. The season is somewhat longer and warmer than at the Edgecombe farm. These two farms have approximately ideal conditions for cotton growing.

The soil of the Iredell farm is almost entirely Cecil Clay with some Clay Loam. The seasons are rather short for cotton, the farm being on the extreme northern border of the cotton belt. Commercially, cotton is not grown

in this section to any great extent.

In this report the following varieties will be used for comparison: Russell's Big Boll, Culpepper's Improved, King's Improved, Excelsior Prolific, Edgeworth, Cook's Improved, and Simpkins's Improved. As will be seen, the Edgeworth variety was the only variety run through a series of six years on more than one farm. This irregularity in the tests made prevents the conclusions from being as definite as they might otherwise have been.

DESCRIPTION OF VARIETIES TESTED.

Russell's Big Boll is a hardy, large bolled and vigorous cotton that yields well on a loam or sandy soil in Eastern North Carolina. It is very popular with the pickers because of the ease and rapidity with which it can be picked. Under average conditions this variety is not only prolific, but fairly reliable. During a seven years test with the above mentioned varieties it stood third on the Edgecombe farm, giving an average yield of 462.72 pounds of lint per acre.

Culpepper's Improved, a large bolled variety, is about ten days earlier than Russell's Big Bolled. It has a large weed with spreading limbs, well bolled and holds cotton well. It is more variable than is Russell's Big Boll, but, notwithstanding this, in the seven years test it stood second on the Edgecombe farm with an average production of 471.97 pounds of lint per

acre.

King's Improved has a smaller boll than either of the aforementioned varieties but runs a little higher in per cent of lint, averaging on the three farms 38.16 per cent for the seven years test. It has a rather small stalk with

spreading limbs fairly well fruited.

Excelsior Prolific has large, deep lobed leaves and short, well matured limbs that bear a rather small boll of high percentage of lint. It often runs above 40 per cent lint, but because of its variability the average would be somewhat under this. On the Edgecombe farm it gave an average yield of 528.86 pounds, leading all others.

Edgeworth has a rather heavy stalk, is short limbed with large leaves and

is rather late in maturing. It runs about 34 per cent lint.

Cook's Improved has large plants, heavily limbed, the lower limbs very long and open; bolls medium size but long, slender and tapering; rather late in maturing. The percentage of lint for a period of six years averaged 39.02. This cotton seems to give a slightly higher per cent of lint on heavy soils than on light soils.

Simpkins's Improved is a small stalked, short limbed variety; a rather heavy fruiter, mediumly early maturing; but maturing at one time rather than continuously, and for this reason is not very well liked where there is a scarcity of pickers. The bolls are small and do not hold the lint very well.

The following table gives the yearly yields of these different varieties of cotton on the different test farms of the State covering a period of seven years.

	1903	1904	1905	1906	1907	1908	1909
Russell's Big Boll:							
Edgecombe Farm	554.53	409.44	616.36	682.61	328.07	362.50	287.5

Simpkins' Prolific:							
Edgecombe Farm					342.80	341.50	426.7
Red Springs Farm	*						
Iredell Farm						402.40	360.0

^{*}Farm discontinued 1905.

From a study of these figures it will be seen that there is a rather wide range of variations in yields of each variety on the same soils and on different soils. It is natural that there should be some variation on soils of different types, but it seems rather striking that there should be such a wide variation on the same soil when the culture and the fertilizers were the same. The climatic changes would, of course, affect the crops of different years somewhat, but hardly enough to justify such a wide variation. The fault would seem to lie with the seed more than anything else. Presumably not enough care was taken in the selection of seed and the quality of seed used.

The following table will help to bring out the variation more forcefully:

Russell's Big Boll: Highest yield	1	Farm	Year
Lowest yield. 287.52 1909 199.05 Difference. 395.09 168.82 Culpepper's Improved: 1699.30 1906 456.98 Highest yield. 699.30 1908 237.51 Difference. 386.00 219.47 King's Improved: 1905 355.48 Highest yield. 667.59 1905 355.48 Lowest yield. 323.91 1903 198.23 Difference. 343.58 157.25 Excelsior Prolifie: 1906 383.41 Lowest yield. 265.50 1908 216.57 Difference. 453.60 168.84 Edgeworth: Highest yield. 625.60 1906 332.52 Lowest yield. 288.10 1908 182.41 Difference. 337.50 150.11 Cook's Improved: Highest yield. 681.87 1906 278.21 Lowest yield. 374.40 1908 * Difference. 307.47 Simpkins' Improved:

^{*}One year only. †Farm discontinued.

A study of this table shows that on the Edgecombe farm there was a much wider range of variation than on either of the others, the Red Springs farm coming second and the Iredell farm giving the least variation. Although the test on the Edgecombe farm gave the widest variations, they also gave the greatest aggregate yield for the period over which the tests were run. This would teach that, if one could obviate this wide variation and still retain the high yielding quality of some of the best varieties of cotton, the section of country adjacent to the Edgecombe farm would be the greatest cotton section of the State. It is entirely possible that this can be done by a system of careful seed selection.

Another striking contrast brought out by these figures is the comparison of yields for the same year on the Edgecombe and Iredell farms. With the exception of Culpepper's Improved, all the varieties gave their largest yields on the Iredell farm the same year that they gave their smallest yields on the Edgecombe farm. Just why this should be is not known. The season of 1908 was very late and this may have affected the growth of cotton more

on the Edgecombe farm than on the Iredell farm, since the cotton was planted on the Edgecombe farm several weeks earlier than on the Iredell farm. And, again, the quality of the seed might have contributed to this difference as seed were not from the same source.

Just here it might be interesting to note the averages of the different varieties on the same soil and on different soils. The following table will

aid in this comparison.

	Average for all Farms	Average for Edgecombe	Average for Red Springs	Average for Iredell
Russell's Big Boll	337.77	462.72	286.08	264.52
Transcer of Dig		7 yrs.	3 yrs.	3 yrs.
Culpepper's Improved	361.16	471.97	345.95	265.58
		7 yrs.	3 yrs.	5 yrs.
King's Improved	367.67	441.84	294.65	366.52
		6 yrs.	3 yrs.	6 yrs.
Excelsior Prolific	379.10	528.86	311.89	296.56
		5 yrs.	3 yrs.	5 yrs.
Edgeworth	339.11	474.83	257.46	285 .04
		6 yrs.	2 yrs.	6 yrs.
Cook's Improved	362.70	468.01	278.21	345.87
		5 yrs.	1 yr.	4 yrs.
Simpkins' Improved	375.78	370.35		381.21
		3 yrs.		2 yrs.

From first glance the difference as brought out by this table would not amount to so very much: in the average for all 41.33 pounds between there is only a difference of highest and the lowest; on the Edgecombe farm there is a difference of júst 157.71 pounds; on the Red Springs farm the difference is 88.48 pounds, and on the Iredell farm the difference is 116.69 pounds between the highest and the lowest yielding varieties. On studying these figures more closely this difference is of decided importance when they are applied to the actual production of cotton in the State or on the individual farm. Just to illustrate: in North Carolina there are about 1,624,000 acres in cotton. If the whole acreage had been in Russell's Big Boll, which gave the lowest average, instead of Excelsior Prolific, which gave the highest average, the loss to the State would have been \$7,955,040. (Allowing the price of cotton to Again, suppose the average farm contains fifty acres of cotton, be 12 cents.) and that the lowest yielding variety is being planted in each locality, the difference between Simpkins's Improved (the lowest) and Excelsior Prolific (the highest) was 158.51 pounds per acre; this would have resuited in a loss of \$951 for each farm adjacent to the Edgecombe farm. The difference between Edgeworth, the lowest, and Culpepper's Improved, the highest, was 88.48 pounds per acre on the Red Springs farm, which difference would result in a loss of \$531 on the adjacent farms. The difference between Russell's Big Boll, the lowest, and Simpkins's Improved, the highest, was 119.69 pounds per acre on the Iredell farm. This difference would amount to a loss of \$695 to the man who planted Russell's Big Boll on farms adjacent to the Iredell farm. Of course these examples are extreme because no variety is planted exclusively. Yet if a farmer, by knowing the adaptations of a variety, can save from \$500 to \$1,000 on a fifty-acre farm, a study of varieties and their adaptation to different sections and different soils and fertilization is of very great importance.

VARIATIONS IN PER CENT OF LINT.

Continuing a study of the same varieties as were used in the study of variations in yields it will be seen that there is also a variation in per cent of lint, both on the same soil and on different soils. This can be shown best by following the same methods as were used in showing differences in yields, namely, tables.

	1903	1904	1905	1906	1907	1908	1909	Aver.
Russell's Big Boll:								
Edgecombe Farm	32.39	34.39	31.75	32.56	31.23	31.95	24.90	31.31
Red Springs Farm		32.81	35.70					34.27
Iredell Farm		35.05	34.98				34.10	34.71
Culpepper's Improved:								
Edgecombe Farm	31.62	35.83	33.07	35.26	31.08	33.80	36.60	33.89
Red Springs Farm		37.50	37.39					37.19
Iredell Farm		34.45	34.98	34.42	35.37		34.60	34.75
King's Improved:								
Edgecombe Farm	36.60	39.20	38.21		35.08	37.40	35.70	37.03
Red Springs Farm		40.62	39.61					39.76
Iredell Farm		37.84	37.10	39.19	36.52	37.92	37.50	37.68
Excelsior Prolific:								
Edgecombe Farm		36.56	35.42	40.93		36.21	41.20	38.06
Red Springs Farm		40.62	39.61					39.21
Iredell Farm		35.45	37.58	39.49		37.09	38.00	37.52
Edgeworth:								
Edgecombe Farm		35.37	33.33	33.99	32.10	32.81	34.40	33.66
Red Springs Farm		35.94	37.15					36.54
Iredell Farm		36.58	35.34	35.21	34 .88	37.21	35.20	35.73
Cook's Improved:								
Edgecombe Farm			37.09	39.03	39.09	38.61	40.20	38.80
Red Springs Farm			40.89					40.8
Iredell Farm			40.87	37.61		39.71	38.90	39.2
Simpkins' Improved:				+				
Edgecombe Farm					35.99	36.68	39.30	37.33
Red Springs Farm								
Iredell Farm				1		37.61	37.70	37.6

^{*}Farm discontinued.

By looking over the column of averages it will be seen that without exception the average per cent of lint for all the varieties was higher on the Iredell farm than on the Edgecombe farm. It will also be noticed that with only one exception the percentage was higher on the Red Springs farm than on either of the others. True, the Red Springs tests were only continued three years. The Edgecombe farm, by reason of its rich soil, its long season and other natural advantages is the nearest ideal for cotton production of the three farms, Iredell farm, because of its short season, heavy soil, cool springs, is the poorest farm for cotton production of the three. Then why this decided difference in per cent of lint in favor of the Iredell farm? It is known that lint consists largely of carbon and that carbon comes through the leaves of the plant. Cotton on the Edgecombe farm suffers greatly from leaf rust, sometimes almost stripped of leaves; on the Iredell farm leaf rust is almost unknown. The natural supposition would be that the cutting off of the leaf area and consequently the amount of carbon in the plant limits the percentage of lint. There has been no investigation along this line, so this is a mere supposition. Yet it would appear that the farmer can well consider the rust resistant properties of his cotton.

A comparison of the lint production and the yield does not seem to show that there is any relation between the per cent of lint and the yield of any one variety on the same soil or on different soils. To illustrate: In 1905 Russell's Big Boll gave a yield of 616.36 pounds of lint per acre on the Edge-combe farm with a percentage of lint of 31.75, while in 1908 it gave a yield of 362.5 pounds per acre with a percentage of 31.95. In 1905 Russell's Big Boll gave a yield of 279.39 pounds per acre on the Iredell farm with a percentage of lint of 34.98. In 1909 it gave a yield of 289.85 pounds of cotton per acre with a percentage of lint of 34.10. By comparing the other varieties in the same way it will be found that they bear out this same fact.

The following table will help to bring out some other contrasts in the variation in per cent of lint of the different varieties under discussion:

	Edgecombe Farm	Year	Red Springs Farm	Year	Iredell Farm	Year
Russell's Big Boll:						
Highest percent	34.39	1904	35.70	1905	35.05	1904
Lowest percent	24.90	1909	32.81	1904	34.10	1909

Simpkins' Prolific:						
Highest percent	39.30	1909	†		37.70	1909
Lowest	35.99	1907			37.61	1908
Difference	3.31				.09	

^{*}One year. †Farm discontinued.

This table brings out the fact that with the same variety there is a greater variation in the per cent of lint on the Edgecombe farm than on either of the others. The most striking difference is with Russell's Big Boll and Culpepper's Improved. Just why this should be is unknown as no records were kept of the growth of these varieties on the different farms. This table again emphasizes the fact that a variety that does best on one soil or in one locality will not always do best on a soil of different character or in another locality.

GENERAL CONCLUSIONS.

1. That there is a rather wide variation in yields of varieties of cotton on the same soil and on different soils.

2. That this variation regulates the profit or loss of a cotton crop more

than most farmers realize.

3. That this variation can be regulated to a large extent by the farmer himself if he will study the adaptation of a variety to his own farm conditions, both as to soil and climate.

4. That, from the knowledge at hand, the variations of one variety on any particular soil can be regulated by a careful and systematic field selection of

seed, and only by this method.

5. That, under present conditions, it is of far more importance to the farmer for him to study his field conditions, his variety of cotton and seed selection, etc., than it is for him to try to regulate the market price of cotton. He has been, is, and will be primarily a producer, and not a regulator of market prices. When he better understands the economic production of cotton under his conditions he can better undertake the regulation of markets.

6. That until the best variety of cotton for a particular farm or locality has been established, and the variations of this variety eliminated as far as possible, there need not be very much emphasis laid on the per cent of lint

that a variety produces.

7. That after the best variety has been established and the controlable variations eliminated it will be well for the increase of the lint to be considered. But I believe that this will automatically increase and establish itself as the other changes are brought about.

8. That there is no variety that can be called the best variety universally.

9. That there is no variety that can be called the best variety for any particular soil or locality.

10. That the establishing of varieties for any particular type of soil, climate or locality is a great work that can be helped materially by the Experiment Stations but must be worked out finally by each individual farmer for his individual conditions.

Feeding Hogs in North Carolina.

BY DAN T. GRAY, CHIEF IN ANIMAL INDUSTRY. .

The Southern people are large meat consumers but small meat producers. In fact, the South consumes more meat per capita than any other section of our country, but a large proportion of this meat is shipped into the South from other sections of the country. This is a very strange condition of affairs when all persons who have studied the question agree that pork can be made as cheaply, and perhaps more cheaply, in the South than in any other section of America.

There are many reasons why North Carolina farmers should introduce this line of animal production into their farming system. In the first place, very little capital is required to make a reasonable start: one hundred dollars invested in hogs represents a rather large beginning, but the same amount of money invested in some of the larger animals would be almost no start at all. In the second place, the sow is a rapid producer; each sow will produce no less than twelve pigs a year if she is given proper care and attention; this means that the money invested in hogs works rapidly. In the third place, the returns begin to come back within a very short time—which is an exceedingly important point for the man with limited capital. In the fourth place, the hog can not be surpassed for its ability to build up the soils rapidly, especially when leguminous crops are grown to supply the pasture.

CORN WHEN FED ALONE IS NOT SATISFACTORY.

The majority of our farmers feed too much corn. It is generally considered that there is no other feed equal to corn for pork production. This is true, provided the corn is used judiciously. But if it be fed alone for any length of time there are few feeds which are poorer. If, however, corn is fed in combination with other feeds, its use is to be highly commended, and it can be used to great economical advantage, too, even though it sells upon the market as high as \$1 a bushel.

The hog is not adapted to living on corn alone, and when we require it of him we are forcing him to do a thing which is not consistent with his nature. Man likes a mixture of feeds or a change in diet; so do the lower animals. The hog in its wild state is omnivorous, feeding upon roots, nuts, fish, grass, snakes, etc.; in fact, but few feeds can be mentioned that he will not eat if he be given the opportunity. Our domesticated hogs have inherited the tendency to select their feed from a variety of substances, and when we enclose them in a pen and give them but one feed we can feel assured that we are not allowing them to reach their highest possibilities.

Experimental data, as well as the experience of our best farmers, show that pork can not be profitably raised and finished upon corn alone when corn sells for 70 cents a bushel. The man who tries to finish hogs on corn alone is following a losing business. There are plenty experiments to show that when corn is worth 90 cents a bushel the cost of each pound of gain will be just about 9 cents; when corn is selling at 80 cents a bushel each pound of gain put on will cost 8 cents; when corn is worth 70 cents a bushel each pound of gain will cost 7 cents; and when corn is worth only 60 cents a bushel pork can be finished for only 6 cents a pound. It appears, therefore, that when 90-cent corn is fed to 7-cent hogs the feeder is losing 20 cents a bushel on his corn. Eight-cent pork must go along with 80-cent corn if the owner is to strike even on feeding corn alone. As a general thing the farmers do not get 8 cents for their hogs. If corn were worth but 40 cents a bushel, as it often is in some of the Western States, it would be a very profitable thing to raise corn and feed it to 6 and 7-cent hogs; good money could be made out of it, as the farmer would then be selling his 40-cent corn, by means of hogs, at 60 and 70 cents a bushel. But even in the corn-belt States it is more profitable to supplement the corn with other concentrates or green crops, and this practice is followed by the best farmers.

CONCENTRATES TO SUPPLEMENT CORN.

Fortunately for the South, it is not necessary to depend upon corn alone, as almost all the crops which can be grown in any part of the country can be grown in the South, and there are many crops suitable for hog feed which can be grown in no other section of the country. This section is wonderfully blessed in its great variety of grain and concentrates, and, in addition, green and pasture crops can be made to spread over twelve months of the year. In fact, with the use of pasture crops the South is in a position to make pork cheaper than any other section of the United States.

As stated before, the hog likes a variety of feeds and thrives better upon a ration made up of two or more feeds than upon one made up of but one. It has been proved by several of the experiment stations that wheat and corn, when fed separately to fattening hogs, are practically equal in feeding value. At the Wisconsin Experiment Station several tests were made to learn the relative value of wheat and a mixture of wheat and corn in equal parts. It was found that 500 pounds of wheat were required to make 100 pounds of gain, but when wheat and corn were fed in equal parts only 485 pounds of the mixture were required to make the same gain. When fed separately, these grains are of equal feeding value, but the mixture of the two was more valuable than either grain when fed alone. While the South has not the wheat, yet the Wisconsin experiments teach the lesson that if the most is to be realized upon the hog and the corn a supplementary feed must go along with the corn.

Among the high-priced concentrated feeds that may be used along with corn and cheapen the ration are skim milk, wheat shorts, and tankage; these three are popular in the South, and are probably the cheapest and best. While the writer was at the Alabama Agricultural Experiment Station, he used all three of these feeds along with corn. The following table illustrates some of the average results:

Table 1-FEEDS TO USE WITH CORN.

Experi- ment	Ration	Average Initial Weight Each Pig	Average Daily Gain Each Pig	Feed to Make 100 Pound of Gain	Cost to Make 100 Pounds of Gain
1	Corn alone	65 lbs.	.39 lbs.	764 corn	\$9.55
	Corn 2/3			339 corn	
	Shorts 1/3	60	.83	169 shorts	7.28
	Comp. 1 mant			296 corn	
	Corn, 1 part	60	1.33	666 skim	6.36
	Dittill illing a 1/0 pilling illing i			milk	
2	Corn alone	45	.12	874 corn	10.93
	Corn, 8/10			293 corn	
	Tankage, 2/10	45	.84	73 tank.	5.12
	Corn, 9/10			475 corn	
	Tankage, 1/10	45	.51	53 tank.	7.00
	Tunings, 1,				

In the above financial estimate, corn is valued at 70 cents a bushel, wheat shorts at \$36 a ton, skim milk at 40 cents a hundredweight, and tankage at \$40 a ton.

In a general statement it may be said that it always paid to supplement the corn with wheat shorts, skim milk, and tankage, the skim milk proving to be the best and cheapest. Throughout all of the above tests the hogs which were fed on corn alone made exceedingly unsatisfactory gains, gaining in one case as low as one-tenth of a pound daily; larger hogs, however, would have done better. The hogs which were fed on one of the supplements along with the corn made satisfactory gains, those which drank skim milk giving almost remarkable results when compared with the results obtained when corn alone was employed.

It should also be noted that the gains were very expensive when corn was fed by itself, in one case going as high as \$10.93 for each hundred pounds of pork made. In the second case above the expense of fattening the hogs was more than cut in half when one-fifth of the ration was made of tankage. In the first test the wheat shorts and the skim milk both saved much corn and cheapened the ration.

PASTURE CROPS TO SUPPLEMENT CORN.

The facts so far presented show one thing clearly—when corn is used alone as a hog feed money is almost sure to be lost. It has also been shown that the feeding value of corn is increased as a result of the use of almost any supplement. But even when corn is assisted by the supplementary feeds mentioned, there are but few cases where 70 cents is realized for a bushel of corn; that is, when hogs sell for six to seven cents a pound live weight. Under present conditions the Southern farmer must see his way clear to realize at least 70 cents a bushel upon b's corn when fed to hogs before he can look upon the hog business as a profitable one. In short, concentrated feeds of all kinds are upon such a high level of prices that the farmer can

not afford to limit the feed of the hog to them alone. Help must be sought outside the concentrated feeds.

The supplementary feeds heretofore mentioned, together with several others, are all good and should be used in hog-feeding operations; but the future of profitable hog production in the South depends upon the use of green or pasture crops. It is possible for the Southern farmer to have grazing crops practically the year through, and many of the best farmers have them. The Southern farmer has, in fact, a decided advantage over the Northern farmer in this respect. We have seen that a variety of feeds almost always produced more satisfactory results than one feed. Pastures and green crops can be used to furnish variety better than any other feeds. The Southern farmer has grown so accustomed to placing his hogs in a small pen when fattening period arrives that he has almost forgotten that the hog can make valuable use of many green crops if he be given the opportunity.

PERMANENT PASTURES.

Until the farmer sees his way clear to make a permanent pasture or has one already made, he should keep out of the live-stock business. It is, in fact, almost impossible to realize a profit upon any kind of stock without good pastures. Therefore, the first thing to be done when one contemplates

engaging in stock raising is to establish a pasture.

The South, which is the very section where they can be made easily, is sadly deficient in pastures. No attention has been given to them; it has all been given to cotton. But the Southern farmer, if he will devote some time and effort to the subject, can have as good a pasture as was ever seen in Kentucky or Missouri, and have that pasture available for grazing more months in the year than is possible in those States. For a permanent pasture there is no combination, either in the North or in the South, that will equal burr clover and Bermuda grass. In many sections the Bermuda can be grazed throughout the summer months and the burr clover from January until the Bermuda comes on again. The combination will afford grazing at least ten months of the year. Both plants are permanent after they are once established. To supplement the permanent pasture, temporary pastures should be grown, as cowpeas, peanuts, etc., but no farmer who has stock can afford to be without this permanent pasture combination to be ready for use when the temporary pastures can not be employed.

RAPE PASTURE.

One of the valuable green crops for hogs is rape. It can be sown in the fall after the summer crops are taken off the land, and within seventy days is ready for the hogs to be turned upon it. It is a winter growing crop, or one that can be used between the two summer crops. As a result of its use the land can be kept in use and covered with green vegetation the year round. Several experiment stations and farmers have demonstrated its value as a hog feed.

TABLE 2-RAPE AS A WINTER CROP FOR HOGS.

T -4	Lot Ration		Feed to Make 100		to Make os. of Pork	Value 1 Acre Rape in
Pot	Ration	Daily Gain	Pounds Pork	Grain	Grain and Pasture	Terms of Corn and Shorts
1	Corn, 2/3	.84	320 corn 160 shorts	\$6.88	\$6.88	
2	Corn, 2/3 Shorts, 1/3 Rape pasture	.74	172 corn 86 shorts .15 acre	3.70	4.90	\$21.20
3	Corn, 2/3 Shorts, 1/3 } 1/4 ration Rape pasture	.54	110 corn 55 shorts .22 acre	2.37	4.13	20.49

In the above financial estimate corn is valued at 70 cents a bushel, shorts at \$36 a ton, and rape pasture at \$8 an acre.

The work was done in Alabama, but the results are entirely applicable to North Carolina, especially the coastal region. This rape crop was sowed after soy beans, on September 21, on a sandy soil. The seed came up well and the hogs were turned on to the pasture November 9 and kept there until April 7, when they were taken off and sold. Five 100-pound pigs were grazed on each acre.

The test shows rape to be an exceedingly valuable winter crop; it saves much corn and other high-priced grains. In fact (see last column above) each acre saved sufficient grain to be worth \$21.20 in one case, \$20.49 in the other case, while the acre of rape did not cost over six dollars. In the lots where the rape pastures were employed, the cost of making gains in weight was very materially smaller than in the lot where dry feeds alone were fed. It cost \$6.88 to make 100 pounds of increase in live weight in Lot 1, where corn and shorts were fed alone. In lots 2 and 3, where rape pastures were grazed, the grain cost to make equal gains was reduced to \$3.70 and \$2.37, respectively. When the expense of planting and cultivating the pastures is also added to the cost of the pork (see column 6), the total cost of making 100 pounds of increase in live weight in Lots 2 and 3 was raised to \$4.90 and \$4.13; the hogs in Lots 2 and 3, therefore, were fattened at an entirely satisfactory profit, while the ones which were finished on corn and shorts in a dry lot, were fattened at a loss, or at least, at an unsatisfactory profit. Rape provides an excellent winter pasture, but other pastures may be used with just about as satisfactory results. Rye, oats, barley, or burr clover may be used to very great advantage.

PLANTS FOR SUMMER PASTURE.

The pigs which are born in late winter and early spring should be finished for the market, or for home killing, the following fall or early winter. It will seldom pay to keep them through the first winter. When the pig is suching the mother, both should be given the run of a pasture crop in order that grain may be saved. If the pig is born in late winter, any of the crops heretofore mentioned can be used until the summer crops begin to come on. When green crops and pastures are thus used, the pig can be gotten up to weaning time as cheaply, perhaps more cheaply, than he can be carried from weaning time to a finish. When the pigs are from 60 to 75 pounds in weight they are ready to begin to finish, and this is the time that the summer pasture crops should be ready to use. This date will be from August to September.

Any reasonably good farmer should experience no difficulty in providing summer and fall pasture crops, as he may take his choice from among cowpeas, peanuts, soy beans, rape, etc. Many farmers and stations have found cowpeas to be an excellent crop for hogs, although no one claims that they afford as much grazing to the acre as do peanuts and soy beans. At the Mississippi station cowpea pasture was grazed without grain. In 1903, although the crop was grown on thin land, one acre of cowpeas produced 350 pounds of pork. In 1904 the crop was grown on good valley land and produced 483 pounds of pork to the acre. The hogs were turned on the crop when the peas were ripe. Better results would no doubt have been secured if the animals had been given the run of the field about two weeks before the maturity of the peas.

In 1906 the Mississippi substation turned 8 sows with their 30 pigs into a red clover pasture of $3\frac{1}{2}$ acres on March 20, the red clover having been sown the previous fall. This furnished ample grazing until August 20, when they were turned into a $4\frac{1}{2}$ -acre lot of corn and peas. The 30 pigs were killed out of this pasture November 1 without the addition of any other feed and dressed 117 pounds each, at an average age of 196 days. The pigs ate approximately 6 bushels of corn each. When land rent is estimated at \$5 an acre, corn at 70 cents a bushel, and the cost of seeding the red clover is also taken into account, each pig cost \$4.98.

It is getting to be a common practice in the Middle States, where cowpeas thrive well, to plant the peas in the corn at the last cultivation and graze the hogs on both crops. This method saves a great amount of labor, and the waste of corn is very small indeed if small pigs are given the run of the field after the fattening animals are taken off; in fact, the loss of corn is not as great as is usually the case when hired help gathers it.

Probably soy beans and peanuts afford the very best obtainable summer, fall, and early winter grazing crops. This, at least, has been the writer's experience. These two crops may be planted in the early part of the summer and be ready for grazing from 80 to 100 days after planting; this, however, depends upon the variety of seed used, the character of soil, etc. Anyway, if they are planted upon the same date the soy beans should be grazed first and the peanuts immediately afterward.

The following tests show how valuable these two crops are:

TABLE 3-PEANUTS AND SOY BEANS AS PASTURES FOR HOGS.

Experi- ment	Experi- Postion Average Make 10		Feed to Make 100 Pounds		to Make s. of Pork	Value 1 Acre in Terms of Corn
			of Pork	Corn	Pasture	Saved
1	Corn alone	.38	609 corn	\$7.61	\$7.61	
	Corn, 1/4		68 corn			
	Soy bean pasture	1.1	.22 acres	0.85	2.59	44 bu.
	Corn, 1/2		138 corn			
	Soy bean pasture	1.0	.2 acre	1.73	3.36	41 bu.
	Corn, 3/4		175 corn			
	Soy bean pasture	1.3	.12 acre	2.19	3.17	63 bu.
	Boy bean pasture	1.0	.12 &010	2.10	0.11	00 20 41
21/4	Corn alone	.33	776 corn	9.58	9.58	
	Corn, 1/2		134 corn			
	Peanut pasture	1.25	.13 acre	1.68	3.08	65 bu.
	Corp. 4/5		111 corn			
	Corn, 4/5 Tank., 1/5		28 tank.	1.95	2.96	34 bu.
s'	1 aux., 1/0)		20 tank.	1.90	2.50	0.500
	Peanut pasture	1.42	.13 acre			476 lb. tank.
	Peanut pasture		.22 acre		1.76	62 bu.
	•					

In the above financial estimates corn was valued at 70 cents a bushel, the pastures at \$8 an acre, and the tankage at \$40 a ton. In some places peanuts should be valued at a very much higher figure than the one used here; if so,

the reader can easily make the necessary changes.

These two pastures were both used to very great advantage, and pork was made at a very low cost when compared with the expense when corn was used by itself. When corn was used alone, it cost over 7½ cents to make each pound of pork; when soy-bean pastures were employed the expense was cut down to \$2.59, \$3.36, and \$3.17 to make each 100 pounds of pork in Lots 2, 3, and 4, respectively. When peanut pasture was grazed it cost from \$1.76 to \$3.08 to make 100 pounds of pork when the pasture was valued at \$8 an acre. The hogs were profitably fattened even when the peanuts are valued at \$24 an acre.

FINISHING HOGS AFTER PASTURE CROPS ARE EXHAUSTED.

The majority of the farmers of the South who make use of green crops for fattening hogs, dispose of the animals when the crops are exhausted, without finishing them upon grain for a short period in a dry lot. There is a time when the hog should be penned up in a lot and fed grain alone, but that time is not at the beginning of the feeding operations. He should be penned up after the pasture crops are gone and fed grain alone for a few days before slaughtering or marketing. There are several reasons for following this plan. First, the hog, after coming off the pasture, is in just the proper condition to make gains economically and rapidly for a short time. He is in excellent health, active, and, as a rule, his frame is not covered with as much fat as it should carry. The pasture has tended to develop his frame at the expense of fat, especially if he is a young animal. After he is fed in a pen twenty-five to twenty-eight days, he looks better, and is better, than when he came off the pasture, and is actually worth more to the consumer or butcher, as he is fatter and will dress out a higher percentage of good marketable meat than if he had been sold directly from the pasture. Second, when hogs have been grazed upon peanuts, soy beans, and certain other green crops, the meat and lard have become soft, which makes the animal objectionable to the butcher as well as for home consumption. This soft meat can be hardened very materially if the hogs are fed upon grain for only a short period after the crops are exhausted.

What shall the animal be fed during this short dry-lot finishing period? Corn is good; corn in combination with cotton-seed meal is better and is cheaper than corn alone, as the addition of cotton-seed meal to the ration renders the meat hard more rapidly than when corn alone is used. If the animals are to be fed not more than twenty-one days in this finishing period, one-third of the total ration may be made up of cottonseed meal. If it is likely that the last period will be extended over more than twenty-one days, the proportion of cottonseed meal should be cut down to one-fifth or one-sixth of the whole ration, and the finishing period extended not beyond five

weeks in all.

A Remedy for Cottonseed Meal Poisoning.

BY W. A. WITHERS.

I presume that it will not be necessary in the presence of so many good, practical farmers to devote much time to the discussion of the danger which accompanies the feeding of cottonseed meal to swine in large amounts, and

for very long periods

Many of you no doubt know from sad experience that sometimes a fine porker fed upon cottonseed meal has been found dead in the morning which appeared perfectly well the previous evening. Sometimes this unfortunate ending may be anticipated from the refusal of the animal to consume the feed. On the other hand, some pigs seem to be highly immune and can eat the meal for long periods and without harmful effects, apparently.

The symptoms of cottonseed meal poisoning which generally have been observed may be briefly stated as follows: When the pig begins to refuse cottonseed meal, he usually shows very rapid, short, shallow breathing, an anæmic condition which shows in the paleness of the mouth, skin and elsewhere, imperfect vision, and even blindness, and a weakening of the muscles of the legs. If the pig is exercised very violently, death usually ensues quickly. A post-mortem examination always shows an ædematous condition of the lungs, and sometimes there is inflammation of the digestive tract.

Many investigators in America and abroad have studied the problem with a view to ascertaining the cause of toxicity and means for overcoming it. The various theories which have been advanced as to what the poisonous substance is, have all been discarded. Lest you throw aside as erroneous the explanation and remedy which we have to offer, I shall endeavor, without going too much into the technical side, to give you an outline of the steps involved in our work, so that you may know the facts which we observed and draw your own conclusions from them.

These experiments were conducted jointly by the Chemical, Veterinary, and Animal Husbandry Divisions of the Agricultural Experiment Station. As Belgian hares, or rabbits, are killed by cottonseed meal in about two weeks, our preliminary experiments were conducted with them instead of with swine, as it takes about twelve weeks to kill the latter. There is also a saving in

expense by using the hares.

A feed may be deleterious or harmful to an animal from several causes: (1) from purely mechanical action such as stopping the intestines, lacerating them, etc.; (2) by not having in it the constituents which are necessary for maintaining the life of the animal; or (3) by having in it some true poison, that is some substance which may be taken into circulation in the blood of the animal and thereby interfere with the physiological processes of the body. We may quickly dismiss the idea of injury in a mechanical way, as there has not been an indication of stoppage of the intestines or of irritation by mechanical means. The remedy for an incomplete or improperly balanced feed would be to increase the missing constituent, and the remedy for a poison would be to remove it before feeding or to change it into an insoluble form so that it would be inert in the body of the animal.

Coming back to the symptoms exhibited by the animals fed on the cottonseed meal, we find that they compared fairly well with those exhibited by animals that have had some soluble sulphide added to their feed. These produce death by acting upon the blood, and diminishing its power of carrying oxygen until death ensues. Some soluble iron salt naturally suggests itself as an antidote. In our experiments with rabbits, we fed one gram of cottonseed meal daily for each 100 grams of live weight. This corresponds to one pound daily for each 100 pounds of live weight of swine, or 10 pounds daily for each 1,000 pounds of live weight of beef or dairy cattle. This will be recognized as rather heavy feeding. The meal was mixed with molasses to make it more palatable. Green feed was given one each day in the form of cowpea vines or cabbages. The rabbits were confined in galvanized iron cages, so as to keep them under close observation.

We began feeding five rabbits with the cottonseed meal. At the end of 14 days, two had died, one was sick, and all had lost in weight. At that time we began adding a solution of citrate of iron and ammonia to the feed. The sick rabbit recovered and all three rabbits gained in weight for the next 14 days, at which time the experiment was discontinued. We took another rabbit which had only eaten 75 grams of cottonseed meal during five weeks and added iron solution to his feed. This rabbit at once began to eat the meal, and after the first week continued to eat all the meal supplied him and gained in weight for five weeks, at which time the experiment was stopped. These four rabbits testify that an iron salt will make them well after they

have been made sick by cottonseed meal.

We took 22 rabbits and fed them with cottonseed meal at the rate referred to, and all died after an average of 13 days, some of them going as early as

the sixth day and only one enduring so long as 22 days. These 22 rabbits

show that cottonseed meal is poisonous.

We began feeding 8 rabbits the same amount of cottonseed meal with all the conditions the same as above, except that an iron salt was added to the feed. We fed 3 of them 64 days, 3 of them 91 days, and 2 of them 106 days, and discontinued the experiment. Each of them remained normal during the whole period, and each ate all the cottonseed meal given. The iron salt enabled them to withstand any deleterious effects of the cottonseed meal, from three to five times as long as the hardiest rabbit could endure the meal without the iron salt. Clearly these 8 rabbits testify to the fact that iron salt kept the meal from making them sick.

We took 3 rabbits that had eaten all the meal given to them for 64 days when an iron salt was mixed with it, and had remained normal during the whole period. At that time we ceased adding the iron salt to their feed. After a few days some of them began to refuse some of their feed, and all of them died in 23 days. Here 3 rabbits testify that an iron salt will make cottonseed meal harmless, and if taken from the feed the meal begins to

show its harmfulness.

To sum up these experiments, 27 rabbits show the poisonous effects of cottonseed meal and 12 show the efficiency of an iron salt in preventing or overcoming its poisonous properties, and in each case the conclusion was clear and unmistakable.

Of course the practical herdsman is not interested in what may happen to rabbits, if the results apply to them alone. The question is, what about swine, or cattle, or sheep? We have not yet been able to undertake to test the efficiency of the iron as an antidote to cottonseed meal if fed to cattle or horses, but we have made some tests with swine. Twelve pigs weighing an average of 50 pounds each were taken and placed in two separate lots, each in a pen to himself. We began feeding to each daily one-half pound of cottonseed meal and 1½ pounds of corn meal. To one-half of the animals we gave in addition a solution of an iron salt. The feed was increased as the animals grew. No green feed was given, and the animal got only such exercise as was possible in a small pen. These conditions are not the best, of course, but we wished to make a severe test. On today,* which is thirteen weeks from the beginning of the experiment, four out of the six pigs receiving the cottonseed meal without an iron salt are dead. The other two have made an average gain of only 35 pounds and do not have a very thrifty appear-On the other hand, the six pigs which received an iron salt with the cottonseed meal have gained an average of 54 pounds, or nearly half as much again as the straight cottonseed meal pigs. The pigs receiving the iron salt are in the best of condition.

Based upon these results, iron salt appears to be of value in diminishing, if not entirely preventing, the harmful effects to swine of cottonseed meal feeding, provided that feeding is not in excess of the rate of one pound of meal daily to each 100 pounds of live weight. It may be of value if the feeding is in larger amounts, but we prefer to confine our statements to the experiments already performed by us. Should an animal refuse his feed, if given cotton-seed meal and an iron salt, I would suggest that the cottonseed meal be withheld from the feed for a few days, until the appetite of the animal returns, and then the meal feeding may be resumed. I should continue the feeding of the iron salt.

I have purposely withheld until the last, directions as to preparing and feeding the iron solution. The directions are so simple that one may easily remember them. Dissolve one pound of copperas (ferrous sulphate) in a barrel (about fifty gallons) of water. For each pound of cottonseed meal take one gallon of the solution, mix thoroughly daily for each 100-pound pig.

^{*}On October 29, 1913, which is twenty-two weeks after the beginning of this experiment, five of the six pigs consuming cottonseed meal without copperas are dead, but all six of the pigs receiving copperas with the cottonseed meal are alive, gaining in weight, and apparently without any ill effects from the cottonseed meal.

If the pig weighs only 50 pounds, use half the amount of cottonseed meal and one-half of the copperas solution.

Reorganizing the Farm.

J. M. JOHNSON.

A system of management which will give greater returns for labor and capital invested in farming in the Piedmont section of the South is needed. It is the western half of North Carolina in which this paper takes greatest interest. It is the agriculture in the section extending westward from the main line of the Seaboard Air Line Railway that shall be considered. In this section, according to the figures given in the 1910 census, the average farm grew crops annually to the value of \$457.00. A study of farm soils, farm equipment, including implements and work stock, and of methods and practices in tillage, convinces one that the yields and values of the crops grown should be much higher than those represented in the census report. When the facts that one-third of the land classified as improved farm land is doing absolutely nothing in the line of growing valuable crops, and that only about one-fifth of the area under tillage gives annual harvests worth \$20.00 or more per acre, while the crops on two-fifths are worth only \$12.00 per acre and on two-fifths the crops are worth less than \$8.50 per acre, is considered, the importance of a better system is recognized.

This system should give more acres of the crops of high value and fewer of those of lower. It should not eliminate crops already grown successfully; neither should it depend upon the introduction of new or untried ones. It should contain nothing of a doubtful nature. It should if possible offer opportunity of utilizing 100 per cent of the improved land in crop growing and in many cases perhaps make farming profitable enough to justify the clearing up or reclaiming good lands now in woods and thus make the farms large enough to allow of improved methods of tillage and so forth. The system should allow the average work animal kept on these farms to do

more days of profit-bearing work per year than at the present.

In order that such a system of management and reorganization may be suggested it may be well to review conditions and practices as existing in 1909

and as yet practically unmodified throughout the Piedmont area.

For careful study we shall take the four counties, Chatham, Randolph. Davidson and Rowan, constituting the heart of western North Carolina, and having the soil and climatic conditions peculiar to the great stretch of Piedmont country from Virginia southward. The value of crops per farm in these counties is about 5½ per cent above the average for the Piedmont section of the State. Some farmers are making good profits, while others are losing money and a great many are practically meeting expenses, but returning no profits.

The lessons drawn from this study will be applicable in the western half of North Carolina, and, the writer believes, in the Piedmont section of the

southeast.

In Chatham County in 1909 there were 3,646 farms with an average of 33.3 acres of improved land and 70.8 acres of unimproved land per farm: 23.3 acres of the improved land was planted to crops. These crops were worth \$439.00 per farm. Ten acres of improved land per farm was uncultivated. The cultivated land grew crops to the value of \$18.85 per acre. Had the 10 acres of improved land which was not planted been occupied in growing crops of only average value, the income on each farm should have been increased \$188.50, or for the county, \$687,271.00.

increased \$188.50, or for the county, \$687,271.00.
On the farms in the county were 5,301 work horses and mules. This is an average of 1.45 head of work stock for each farm, or one work animal for each 16 acres in crops. Had the entire 33.3 acres been planted there would

have been one work animal for every 22.9 acres to be cared for.

In Randolph County there were 4,011 farms averaging 36.1 acres of improved and, 71.9 acres of unimproved land per farm. Of the improved land 22.92 acres per farm were planted to crops which produced a cash value of \$396.14 or \$17.23 for each acre planted. There was an average of 13.18 acres of improved land per farm in this county unplanted. Had this produced only average crops the income per farm should have been increased \$227.09 or for the county \$910,858.00.

Randolph County had 6,462 head of work horses and mules, which is equivalent to 1.61 per farm or one for every 14.25 acres planted or for every

22.4 acres of improved land.

Davidson County reports 3,505 farms with an average of 41.9 acres of improved and 52.6 acres of unimproved land. Of the improved land 27.2 acres is planted to crops which yield a value of \$502.17 per farm or \$18.46 per acre cropped. There remains 14.7 acres of improved land, per farm, unplanted. Had this been devoted to crops yielding harvests of only average value per acre the income per farm should have been increased \$269.36, or for the county \$944,106.00.

In Davidson County there are 5,900 work horses and mules. This is 1.68 work animals for each farm or one such animal for every 16.2 acres cropped,

or for 249 acres of improved land.

Rowan County has 3,241 farms with 44.1 acres of improved land and 45.1 acres of unimproved per farm. Of the improved land 32.9 acres per farm is planted in crops which give a harvest worth \$617.95 or \$18.78 for each acre planted. There remains 11.2 acres of improved land, per farm, unplanted. Had this made crops in value equal to the average of the cropped land, there should have been added to the income of each farm the sum of \$210.33, or for the county this increase should amount to \$681,679.53.

From figures given it seems a system of farming which would allow the utilization of every acre of improved farm land in the counties considered should add to the income of the average farm as follows: Chatham County, \$188.50; Randolph, \$227.09; Davidson, \$269.36, and Rowan, \$210.33, or a sum total of nearly three and a quarter million dollars for the four counties.

Is it possible for the farmers to reorganize their business on a basis to allow of such an increase in income without a corresponding growth in out-

lay or in operating expense?

In laying the foundation for the answer to this question a further study of present farm organiztaion embracing cropping systems now followed is

necessary.

In Chatham County the average farm of 33.3 acres of improved land has 10.38 acres in corn; 3.8 in cotton; 5.04 in wheat; 2.13 in oats; .75 in hay and 1.22 in miscellaneous crops including tobacco. The average acre in cotton is worth \$30.00, while that in corn is worth \$12.00, wheat \$7.00, oats \$6.00, hay \$22.00.

In Randolph County the average farm or 36.1 acres of improved land has 10.33 acres in corn, .44 in cotton, 7.39 in wheat, 1.70 in oats and 1.95 in hay. The average acre in cotton is worth \$25.00; that in corn is worth \$12.00; that

in wheat \$9.00; that in oats \$7.00; in hay \$20.00.

In Davidson County the average farm of 41.9 acres of improved land has 9.27 acres in corn; 1.66 in cotton; 8.80 in wheat; 2.01 in oats and 3.88 acres in hay. An acre of cotton is worth \$24.00, while corn is worth \$12.00, wheat \$9.00; oats, \$6.00, and hay, \$25.00.

In Rowan County the average farm of 44.1 acres of improved land has 11.25 acres in corn; 6.1 in cotton; 7.15 in wheat; 3.05 in oats, and 4.17 acres in hay. Cotton is worth \$24.00 per acre; corn \$12.00, wheat \$8.00, oats

\$7.00, hay \$24.00.

The four counties under review have 14,403 farms. These farms average 38.6 acres of improved land. The unimproved land in farms averages 60.9 acres per farm. There are 1.65 work animals (horses and mules) per farm. Were the entire 38.6 acres devoted to farm crops, including hay plants, the

average work animal would have 23.4 acres to care for. Under the conditions and practices prevailing in 1909 these farms had only 24.92 acres each devoted to crops. This means that the average work animal cared for 15.1 acres of land. Should the farmers expect more than this from one horse? Can they get more than this amount of productive work from each horse

kept? These are points to be considered.

The crop system followed on the average of these farms called for 10.14 acres in corn and 2.87 acres in cotton; by adding .99 of an acre for miscellaneous spring planted crops to the above, there would be 14 acres of land per farm requiring breaking and preparing for spring planting. If this breaking is done with one-horse plows it should require from 16 to 20 days for one horse. All the harrowing given should not require more than four days. Laying off rows and putting down fertilizers should not take more than six days work for one horse. Six days again for bedding and planting brings the horse work on the 14 acres up to 36 days at the time the last seed goes into the ground. The time required to cultivate these crops should not exceed five days for one horse each time they are gone over. If they are worked five times in the course of the spring and summer a maximum of 25 days for a horse will be required after the crops are planted and by the time they are laid by. A liberal allowance at harvest and market time should call for not to exceed 10 days of horse work. Thus in making 14 acres of cultivated crops as grown per farm in 1909 may possibly demand 71 days of work for one horse.

This farm, though, has 7.1 acres in wheat, 2.2 in oats and 2.6 acres in hay; or a fraction less than 12 acres in all these crops. Fall preparation and planting is called for in case of the wheat and better yields may be expected from fall planted oats. These two crops occupy 9.3 acres. Allowing 20 days for one horse on wheat and oats and 9 days on the 2.6 acres in hay, we get a total of 100 days of horse work actually required in taking care of all

the crop work on the average of these farms.

The farm has 1.65 work animals to do 100 days work per year. This means that the average work animal (horse or mule) does only 60 days of farm work per year. Is it reasonable to expect more than this from him? Will it pay his owner to exact more days work and more acres cultivated for each horse or mule?

Fortunately we have records on a number of farms in the Piedmont section of North Carolina which throw some light on this point. Let us look to one of these farms. On this farm we find 288 acres of crops grown; corn 100 acres; cotton 75; wheat 50, hay and miscellaneous crops making up the rest. Ten head of work stock taking care of all this, or an average of 28.8 acres for each horse or mule on the place. After every expense, including interest on the investment, is paid, this farm shows a clear profit of \$2,900, or \$290 00 profit for each head of work stock used. Other farms, some much smaller, show proportionately as good results.

It is reasonable to expect more than 60 days work from each horse or mule kept on the farm in the Piedmont section of North Carolina as well as other southern states. It should pay the farmer to exact more days of productive work from the work stock, and thereby make a greater quantity

of valuable crops.

The farm should be organized to allow each head of work stock to care for a minimum of 23 acres of land in crops of commercial value. Such a system should call for not less than 100 days wor's per year from each head of work stock kept. In all probability the farm would be more profitable if 150 days of work at productive enterprises could be exacted from each horse. The South may not be ready for such a system at the present, but her farmers should begin to plan for it and gradually grow to it.

Doubtless it is more difficult to organize a small farm on the better basis than a large one. It is not easy to get more than 75 days of work annually for a horse at profitable enterprises on farms as now organized and grow

from 15 to 16 acres of cultivated crops for each work animal kept. When these farms become organized on a basis calling for two-horse teams, with from 45 to 50 acres in cultivated crops per team, it will be an easy matter to get from 100 to 120 days of profit earning work for each head of work stock. The difficulties standing in the way of such organization are more apparent than real. The average farm no whas 23.4 acres of improved land per work animal. The system proposed will require the utilization of all this land. On a great number of farms only one horse is kept at the present. It will be wise for men working such places to exchange teams with one another a few days at the periods of heavy work, especially such as breaking land and harrowing it and also at harvest time. This will give each farm the advantages of a better prepared soil and the more efficient methods of cultivating and harvesting. Where two or more horses are already kept, these should be hitched into the double teams and used with bigger plows and other machinery necessary for good farming.

The organization of a two-horse farm having 50 acres of improved land may be as follows: 12 acres in cotton, 12 in corn and 12 in small grain, using wheat on a part and oats on the remainder, but proportioning the acreage of the respective grains to the needs and demands of the farm. The small grain should be followed by a crop of peas for hay. About 4 acres for all miscellaneous crops, and 10 acres for grass for hay and if there is no other grazing land a part of the grass may be used for pasture. For the one-horse farm the acre to each crop may be reduced proportionately.

The 24 acres for corn and cotton will be to plow after fall crop work is out of the way and before time to plant in the spring. After the land is plowed it should be harrowed, then the rows are to be layed off, fertilizers

applied and perhaps in many cases bedded before planting.

A two-horse team with a turn plow will break approximately 1.75 acres in a day. Thus it may require 14 days to break the 24 acres. Another four days will be needed to do the harrowing. Six days with two horses should open all rows and put down the fertilizers. Six days again should do the bedding and planting. Cultivating these crops an average of five times should require not more than 35 days of horse work. Harvesting and housing the corn and cotton will require not more than one day of horse work per acre or 24 days for handling both crops. Allowing 12 days for all extra horse work, we have the 24 acres of corn and cotton made at an enpenditure of 131 days horse work.

The horse work required in caring for the 12 acres in small grain followed by peas for hay should not exceed 4 days per acre, or 48 days for the two crops. Allowing 25 days of horse work on the four acres of miscellaneous crops and 20 days on the permanent hay and pasture lands, we have a sum total of 223 days of horse work required on the 50-acre farm organized on the suggested basis. This is 111.5 days work for each horse instead of 60 days as by the system prevailing on the same farms in 1909 and which has not

been greatly modified in recent years.

IMPORTANCE OF PROPOSED SYSTEM.

Under the system prevailing during the past few years the farmer cultivated 24.92 acres of land with 1.65 head of work stock and grew crops to the value of \$482. Or one horse does the work on 15.1 acres, making crops worth \$277. The average farm has 13.7 acres of improved land doing nothing, while 60.9 acres remain unimproved. The proposed system calls for the utilization of all the improved land in profit producing enterprises. It will also call for bringing under cultivation of from 12 to 15 acres of the most fertile of the unimproved lands and the cultivating of this reclaimed acreage in valuable crops.

Allowing the yields and values per acre of the respective crops to remain in years to come the same as in the past, let us see how the earning of the farm is affected:

Cotton, 12 acres, @ \$26.40\$	316.80
Corn, 12 acres, @ \$12.00	144.00
Small grain—	
10 acres in wheat, @ \$9.00 per acre	90.00
2 acres in oats, @ \$6.00 per acre	12.00
Pea Hay, 12 acres, @ \$20 per acre	240.00
Grass Hay, 10 acres, @ \$23.38 per acre	233.80
and the second s	
Total, 46 acres crops value\$	1,036.60

These figures are based on the supposition that the change in system would not tend to increase yield per acre of any of the crops now grown. This assumption is not entirely correct, as it is well known that a change from one-horse to two-horse farming, especially when accompanied by more liberal use of cow peas and other legumes in the rotation, is followed by increased yields from each and every crop grown. Increased yields with prices remaining stationary means increased income for the farm.

Under the system proposed the corn yields should average double what they are under the present. Cotton should be influenced in a like manner. Small grain yields should be increased from 50 to 100 per cent. Hay should make a very material increase.

After the proposed system has been in operation for a period of five years, the better farms of the two-horse or 50-acre class should show incomes of from \$750 to \$1,000 after all expenses are paid.

To some it may seem that there is too much land devoted to cotton for the amount of labor available at chopping and picking times. If conditions are not favorable to this portion of the land in cotton, it may be reduced without materially affecting the income, provided the right crops are substituted. The average acre of cotton under prevailing conditions is worth \$26.40, while an acre of hay is worth \$23.38. If half the cotton land be planted to hay crops of only average value, the farm income suffers a reduction of \$18.12. The saving in labor and fertilizer would in all probability overbalance the difference in the value of the cotton dropped and the hay added to the cropping system.

Unless the yields of small grain and corn increase very materially, their acreage should not be increased, and it may be advisable to quit growing wheat and oats for grain, but to handle these as cereal hay crops. In either case every acre growing the wheat, oats or other small grain as a hay or grain crop should be planted to peas or other summer growing legumes as soon as possible after grain or cereal hay crops have been harvested. The summer grown crop of peas or other legumes may be harvested for hay, or if soil conditions and the needs of the farm are such as to justify they may be plowed under and thereby increase the yields of other crops in the pasture.

The secret of success lies in keeping all the tillable land busy in growing valuable crops and to have enough tillable land to give the teams profitable employment as many days as possible during the year. The cropping system should be such as to keep the available labor employed on profitable enterprises during as many months in the year as possible.

LETTER OF TRANSMITTAL

MAJOR W. A. GRAHAM,

Commissioner of Agriculture.

Dear Sir:—I am sending you herewith a manuscript discussing in a brief way the results of the variety test work done with corn on the Test Farms and at different points in the State during the past season. This work has been carried out according to plans made and inaugurated by J. L. Burgess, Agronomist in Cereal Investigations. The tables and other data have been arranged and the report written by G. M. Garren, assistant Agronomist in Cereal Investigations.

I recommend the publication of the manuscript as the February BULLETIN.

Respectfully submitted,

C. B. WILLIAMS, Chief, Division of Agronomy.

VARIETY TESTS OF CORN FOR 1913

BY G. M. GARREN. ASSISTANT IN CEREAL INVESTIGATIONS.

Herewith is submitted the tables of the results of the annual tests of varieties of corn on the different Test Farms. This year there were six tests made, one each on the Buncombe Farm, the Iredell Farm, the Central Station at Raleigh, the farm of the Tobacco Station at Oxford, the Edgecombe Farm, and on land adjoining the black land farm at Winona. A severe storm September 3d so injured the crop at Winona that the results were lost altogether. Owing to an accident only a few of the varieties at the Oxford Station were saved and only partial data on these were possible. The weights of the cobs from the bushels of shelled corn were lost and this almost ruined the entire results. The yields of bushels of shelled corn per acre, upon which the rating of the varieties are based, were found by dividing the pounds of ears per acre by 70, the standard commercial number of pounds of ears of dry corn required to shell one bushel, instead of the actual number of pounds, found by weighing the corn when harvested, as was used in all the other tables. This gives, therefore, only an approximation instead of actual yields.

The tables in form are the same as those published in previous issues of the Corn Bulletin. They are, therefore, by this time fairly intelli-

gible to all interested readers.

Under given conditions the largest yield of corn depends upon three things: the number of stalks on the land, the number of ears on the stalks, and the size and shape of the ears. By size and shape of ears is meant their shelling capacity, not mere bulk. Any attempt to supply artificially either one of these elements when defective or lacking altogether, destroys field conditions, under which all such tests have to be conducted to be of practical value. The only one of these elements that any reasonable attempt can be made to supply when lacking is that of stand. Perfect stands are almost unknown. Sometimes the stand of one variety is almost perfect; another along side of it very poor. Obviously it is very difficult to make a fair comparison of yields with such unequal stands. An effort has been made in the fourth column under head of "Yields Per Acre" to overcome this difficulty. Here the yields per acre have been calculated on the basis of a perfect stand. It is a mere calculation but gives a fair working idea of the actual differences in yields among the varieties. At the Buncombe Farm the stand was made perfect by supplying the missing stalks from another part of the plat. Obviously this method takes no note of whether the supplied stalks had the average number of ears or whether the ears were the average size. Neither does it take note of the average per cent of barren

stalks. It is less reliable than the calculation methods. Like the latter, it only aids one to get an idea of the real differences in yields of the varieties when the stand is abnormal.

In Table I are recorded the results at the Buncombe Test Farm. The weights of the shelled bushels of corn are very low, far below the standard. The growing season in the mountains this year was unusually short. The frost struck the corn before it fully matured. Hence it is light and chaffy. Boone County, Whitson, Brooks' Pride, Golden Prolific, and White Majestic are the five highest yielders. Boone County and Whitson have the same rank. Whitson has fewer barren stalks and therefore really ranks first. It is a native corn and thoroughly acclimatized.

The results at the Iredell Farm are recorded in Table II. Only 26 varieties were tested and upon the whole it was the most satisfactory test of the whole year. Weekly's Improved, with 36 barren stalks out of a total of 281, ranked first in yield. It had been improved for two years in the grain-breeding work of the Division of Agronomy, and came from Selection No. 35, made in 1910. Being acclimatized and improved by seed selection explains in large part its high yield. Golden Prolific, Southern Beauty, Weekly's Improved (South Carolina grown) and Sanders' Improved make up the five highest yielders in this test.

The results at the Central Station at Raleigh are recorded in Table III. A larger number of varieties than at any of the other stations were tested here. First rank was taken by First Generation of Cross No. 182. This variety, along with several others, was furnished by the Bureau of Plant Industry at Washington. These varieties are designated by number and may be so recognized. This is the second year these varieties have been tested in the State, and the first time any one of them has taken the lead. Biggs' Seven Ear, one of the best prolific corns for Eastern Carolina, takes second place. Cocke's Prolific, another most excellent variety for Eastern Carolina, comes third. Golden Prolific and Marlboro's Prolific (Tennessee grown) make up the five highest yielders.

Table IV contains the results of the test at the Edgecombe Farm. Here the per cent of ears to stover is unusually high. The corn was blown down by the September storm and was not harvested till late in the season. Consequently all the stover was practically destroyed except the bare stalks. This is especially true of the early maturing varieties. Batts' Four Ear (Georgia grown), Weekly's Improved (North Carolina grown), Latham's Double, Weekly's Improved (South Carolina grown), and Parker's Prolific, all prolific varieties, are the five leading

varieties in this test.

In Table V are found the results of the test on the farm of the Oxford Tobacco Station. Here Parker's Prolific, Cocke's Prolific, and Biggs' Seven Ear, the three leading prolific varieties of Eastern Carolina, and Hickory King and First Generation of Cross No. 182, two single-eared varieties, make the five highest yielders. But on account of a different and less accurate method of computation as noted above, this table is less reliable than any of the others.

In Tables VI and VII are the compiled results of the tests of seven varieties for five years on the Iredell and Edgecombe Farms. Whenever a variety maintains the lead for five or more years, one is safe in concluding that that variety is well adapted to the locality in which it was grown. Any farmer living in the vicinity of the Iredell and Edgecombe farms can plant a pure acclimatized strain of Weekly's Improved or Biggs' Seven Ear, the leading variety of these respective farms, with a reasonable certainty of obtaining maximum results, so far as variety influences those results.

TABLE 1.—VARIETY TEST OF CORN AT THE BUNCOMBE TEST FARM IN 1913.

	Rank According to Yield	-	-	6	00	ಣ	7	5	9	-1	œ	6	10	Ξ	12	13	22	53	14	15	16	17	8	61	19	61

LETTER OF TRANSMITTAL.

Raleigh, N. C., February 15, 1914.

HON. W. A. GRAHAM,

Commissioner of Agriculture.

Sir:—I submit herewith analyses of fertilizers made in the laboratory of samples collected during the past full. These analyses show fertilizers to be about as heretofore, and to be, generally, what was claimed for them. I recommend that it be issued as the March Bulletin.

Very respectfully,

B. W. KILGORE,

State Chemist.

Approved for printing:

W. A. Graham,

Commissioner.

I. ANALYSES OF FERTILIZERS—FALL SEASON, 1913.

By B. W. KILGORE,

W. G. HAYWOOD, J. Q. JACKSON, E. S. DEWAR, AND E. B. HART.

The analyses presented in this BULLETIN are of samples collected by the fertilizer inspectors of the Department, under the direction of the Commissioner of Agriculture, during the fall months of 1913. They should receive the careful study of every farmer in the State who uses fertilizers, as by comparing the analyses in the BULLETIN with the claims made for the fertilizers actually used, the farmer can know by or before the time fertilizers are put in the ground whether or not they contain the fertilizing constituents in the amounts they were claimed to be present.

TERMS USED IN ANALYSES.

Water-soluble Phosphoric Acid.—Phosphate rock, as dug from the mines, mainly in South Carolina, Florida, and Tennessee, is the chief source of phosphoric acid in fertilizers.

In its raw, or natural state, the phosphate has three parts of lime united to the phosphoric acid (called by chemists tri-calcium phosphate). This is very insoluble in water and is not in condition to be taken up readily by plants. In order to render it soluble in water and fit for plant food, the rock is finely ground and treated with sulphuric acid, which acts upon it in such a way as to take from the three-lime phosphate two parts of its lime, thus leaving only one part of lime united to the phosphoric acid. This one-lime phosphate is what is known as water-soluble phosphoric acid.

Reverted Phosphoric Acid.—On long standing some of this water-soluble phosphoric acid has a tendency to take lime from other substances in contact with it, and to become somewhat less soluble. This latter is known as reverted or gone-back phosphoric acid. This is thought to contain two parts of lime in combination with the phosphoric acid, and is thus an intermediate product between water-soluble and the original rock.

Water-soluble phosphoric acid is considered somewhat more valuable than reverted, because it becomes better distributed in the soil as a consequence of its solubility in water.

Available Phosphoric Acid is made up of the water-soluble and reverted; it is the sum of these two.

Water-soluble Ammonia.—The main materials furnishing ammonia in fertilizers are nitrate of soda, sulphate of ammonia, cotton-seed meal, dried blood, tankage, and fish scrap. The first two of these (nitrate of

soda and sulphate of ammonia) are easily soluble in water and become well distributed in the soil where plant roots can get at them. They are, especially the nitrate of soda, ready to be taken up by plants, and are therefore quick-acting forms of ammonia. It is mainly the ammonia from nitrate of soda and sulphate of ammonia that will be designated under the heading of water-soluble ammonia.

Organic Ammonia.—The ammonia in cotton-seed meal, dried blood, tankage, fish scrap, and so on, is included under this heading. These materials are insoluble in water, and before they can feed plants they must decay and have their ammonia changed, by the aid of the bacteria

of the soil, to nitrates, similar to nitrate of soda.

They are valuable then as plant food in proportion to their content of ammonia, and the rapidity with which they decay in the soil, or rather the rate of decay, will determine the quickness of their action as fertilizers. With short season, quick-growing crops, quickness of action is an important consideration, but with crops occupying the land during the greater portion, or all, of the growing season, it is better to have a fertilizer that will become available more slowly, so as to feed the plant till maturity. Cotton-seed meal and dried blood decompose fairly rapidly, but will last the greater portion, if not all, of the growing season in this State. While cotton seed and tankage will last longer than meal and blood, none of these act so quickly, or give out so soon, as nitrate of soda and sulphate of ammonia.

Total Ammonia is made up of the water-soluble and organic; it is the sum of these two.

The farmer should suit, as far as possible, the kind of ammonia to his different crops, and a study of the forms of ammonia as given in the tables of analyses will help him to do this.

VALUATIONS.

To have a basis for comparing the values of different fertilizer materials and fertilizers, it is necessary to assign prices to the three valuable constituents of fertilizers—ammonia, phosphoric acid, and potash. These figures, expressing relative value per ton, are not intended to represent crop-producing power, or agricultural value, but are estimates of the commercial value of ammonia, phosphoric acid and potash in the materials supplying them. These values are only approximate (as the costs of fertilizing materials are liable to change, as other commercial products are), but they are believed to fairly represent the cost of making and putting fertilizers on the market. They are based on a careful examination of trade conditions, wholesale and retail, and upon quotations of manufacturers.

Relative value per ton, or the figures showing this, represents the prices on board the cars at the factory, in retail lots of five tons or less, for cash.

To make a complete fertilizer the factories have to mix together in proper proportions materials containing ammonia, phosphoric acid and potash. This costs something. For this reason it is thought well to have two sets of valuations—one for the raw or unmixed materials, such as acid phosphate, kainit, cotton-seed meal, etc., and one for mixed fertilizers.

The values used last season were:

VALUATIONS FOR 1913.

In Unmixed or Raw Materials.

For phosphoric acid in acid phosphate	4	cents per pound.
For phosphoric acid in bone meal and Peruvian Guano.	$3\frac{1}{2}$	cents per pound.
For phosphoric acid in basic slag		
For nitrogen	$19\frac{1}{2}$	cents per pound.
For potash	4	cents per pound.
In Minad Fantilizana		

In Mixed Fertilizers.

For	phosphoric acid	$4\frac{1}{2}$	cents per pound.
For	nitrogen	21	cents per pound.
For	potash	5	cents per pound.

HOW RELATIVE VALUE IS CALCULATED.

In the calculation of relative value it is only necessary to remember that so many per cent means the same number of pounds per hundred, and that there are twenty hundred pounds in one ton (2,000 pounds).

With an 8-2-1.65 goods, which means that the fertilizer contains available phosphoric acid 8 per cent, potash 2 per cent, and nitrogen 1.65 per cent, the calculation is made as follows:

Percentage or Lbs. in 100 Lbs.	Value Per Value Per Ton, 100 Lbs. 2,000 Lbs.
8 pounds available phosphoric acid at 4½ cents 2 pounds potash at 5 cents	$0.10 \times 20 = 2.00$
Total value	$0.817 \times 20 = $

Freight and merchant's commission must be added to these prices.

LETTER OF TRANSMITTAL

Hon. W. A. Graham, Commissioner of Agriculture.

Sir:—I submit in manuscript a report covering experiments with cotton on the Edgecombe Test Farm for the years 1903-'09, inclusive, together with a discussion of the results. B. W. Kilgore and C. B. Williams are responsible for the plans and conduct of the work in 1903-'07; B. W. Kilgore and G. M. MacNider, 1907-'09. R. W. Pou and R. W. Scott, Jr., had charge of the culture and handling of the crop and E. L. Worthen and W. C. Etheridge did the main work in putting the results in tabular form. C. B. Williams is responsible for the conclusions and the writing of it.

I recommend the publication of this report as the April BULLETIN.

Very respectfully,

C. B. WILLIAMS, Chief, Division of Agronomy.

Approved for printing:

W. A. GRAHAM,

Commissioner.

FERTILIZER EXPERIMENTS WITH COTTON ON THE SANDY LOAM SOILS (NORFOLK SANDY LOAMS) OF THE COASTAL PLAIN

Being a Report of Work with Cotton on the Edgecombe Test Farm in 1903-1909, Inclusive

BY B. W. KILGORE, C. B. WILLIAMS, G. M. MACNIDER, AND R. W. SCOTT, JR.

GENERAL SUMMARY OF RESULTS OF FERTILIZER TESTS

1. The proper fertilization of cotton pays large profits, larger ones than any other staple crop generally grown in the State. What this fertilization should be on these and similar soils is shown by the results

of our experiments as given on the following pages.

2. In the production of cotton on this land with only two constituents used nitrogen combined with potash afforded the largest net returns per acre, while a mixture of nitrogen and phosphoric acid gave the smallest profit. The use of phospphoric acid and potash averaged \$4.06 more profit per acre than phosphoric acid and nitrogen, but it was not so great by \$6.24 per acre as that secured on an average by the use of a mixture carrying nitrogen and potash.

The experiments as a whole show nitrogen to be the dominant or controlling constituent of plant-food for increasing yields and adding the

greatest profit per acre in growing cotton on this type of soil.

3. The results show that lime alone has been used on an average at a small profit. In combination with nitrogen, phosphoric acid and potash to make a complete fertilizer it has shown an annual increased profit of \$6.17 per acre above the net returns secured from the use of the complete fertilizer alone.

The results show that for cotton growing on this type of land the use of moderate quantities of lime particularly in connection with a com-

plete fertilizer will prove quite profitable.

4. The amount of nitrogen used in the normal fertilizer (400 pounds per acre), applied in these cotton experiments, was 2½ per cent, or 10 pounds to the acre. This amount was varied so as to give 5, 10, 20 and 30 pounds of nitrogen per acre. The yields and profits per acre were increased as the applications of nitrogen were made larger. As an average of all the results on the two fields, both increase in the yield due to fertilizer and in profit per acre were almost tripled by the use of 30 pounds of nitrogen with normal amounts of phosphoric acid and potash over what they were where only 5 pounds of nitrogen was used with normal amounts of phosphoric acid and potash. The former application on an average gave a profit of \$26.45 per acre over cost of fertilizer applied. The increase of 25 pounds of nitrogen in the formula

(from N½PK to N₃PK) has resulted in returns on an average equivalent to 69 cents for each pound of nitrogen added between 5 and 30 pounds per acre. The use of 30 pounds of nitrogen, with the exception of the two and one-half times normal fertilizer application, was the most profitable one tried. Five pounds of nitrogen would be supplied by 81 pounds of 7½ per cent cottonseed meal, by 40 pounds of 15 per cent

dried blood or by 34 pounds of 18 per cent nitrate of soda.

5. The amount of phosphoric acid in the normal fertilizer (400 pounds per acre) was 7 per cent which is equivalent to 28 pounds per acre. This quantity was varied so as to apply 14, 28, 56 and 84 pounds respectively of phosphoric acid per acre, with normal amounts of nitrogen and potash. These amounts of phosphoric acid would be supplied by 100, 200, 400 and 600 pounds respectively of 14 per cent acid phosphate. The greatest net returns over cost of fertilizer per acre was secured in the study of the most profitable quantity of phosphoric acid

to use on cotton, by the use of 28 pounds per acre.

6. The amount of potash in the normal fertilizer (400 pounds per acre) was 2½ per cent, equivalent to 10 pounds per acre. Varying this amount so as to apply 5, 10, 20 and 30 pounds per acre respectively, the results indicate (with one apparently abnormal exception) that the largest profit over cost of fertilizer from different quantities of potash was obtained from the use of about 20 pounds of potash with normal amounts of nitrogen and phosphoric acid. To supply 20 pounds per acre of potash will require an application of 167 pounds of 12 per cent kainit, 100 pounds of 20 per cent manure salt, or 40 pounds of 50 per cent muriate or sulphate of potash.

7. Varying the amounts of the normal fertilizer applications from 200 to 1,000 pounds per acre gave progressively increased yields and profits as the quantity of fertilizer was made larger, the results being quite uniform on an average in this regard. The averages, after de-

ducting for cost of fertilizer showed the following net profits:

200 pounds of fertilizer per acre gave a profit of \$ 5.95.

400 pounds of fertilizer per acre gave a profit of 11.45.

600 pounds of fertilizer per acre gave a profit of 23.70.

800 pounds of fertilizer per acre gave a profit of 31.63.

1,000 pounds of fertilizer per acre gave a profit of 34.47

Putting this in a slightly different way, on an average the first 200 pounds of fertilizer yielded a net profit (after deducting for the cost of fertilizer) of \$2.98 for each 100 pounds of fertilizer; the application of 400 pounds yielded \$2.86 per 100 pounds; 600 pounds yielded \$3.95 per 100 pounds; 800 pounds yielded \$3.95 per 100 pounds; and 1,000 pounds in the distance of the pounds of fortilizer.

pounds yielded \$3.45 profit per 100 pounds of fertilizer.

8. Comparisons of dried blood and nitrate of soda as sources of nitrogen showed no great advantage one over the other in the production of cotton on this type of soil. In the tests nitrate of soda was applied one-half at planting and one-half about July 1, on one plat; one-half was applied about July 1, the other half of the nitrogen coming from dried blood, which was applied before planting on another plat, and

on a third plat nitrate of soda furnished one-fifth of the nitrogen, the balance coming from dried blood, all being applied before planting. The blood was applied one-half at planting and one-half about July 1, on one plat; one-half at planting, the rest of the nitrogen coming from nitrate of soda which was applied July 1 on another plat, and on a third plat four-fifths of the nitrogen was supplied by blood and one-fifth by nitrate of soda. The most economical method of application and the one which made the highest yield of seed cotton was the one which received half of the nitrogen as dried blood in the row at planting with normal quantities of phosphoric acid and potash and the remaining half of the nitrogen as a side dressing in the form of nitrate of soda about July 1.

9. Where 400 pounds of fertilizer were applied each in the drill before planting, broadcast before planting, and divided into two equal parts, one-half being applied in the drill before planting and the other half as a side dressing about July 1, the results are not uniform, but on an average seem to indicate best returns from applying one-half of the fertilizer in drill at planting and other half alongside the row

about July 1.

10. Where only 400 pounds is used to the acre the best and most economical returns will be in the drill or alongside the row rather than to be applied broadcast.

11. Our analyses of the various soils of the State indicate that these results will apply to the sandy and fine sandy (Norfolk) loams of the

upper Coastal Plain section of the State.

12. In the production of cotton on these soils, taking the results here reported as a whole, it is recommended that at least 400 pounds of fertilizer be used and as much more as can be afforded up to 1,000 pounds per acre. The fertilizer can be most profitably applied in the drill before planting; one-half at planting and the other half as a side dressing about July 1; one-half of the nitrogen as blood, cottonseed meal, fish scrap or tankage in the row at planting with all the phosphoric acid and potash and the remaining nitrogen as nitrate of soda as a side dressing about July 1; or all of the nitrogen in some of the recognized organic forms of carriers of nitrogen with the phosphoric acid and potash at planting.

On land deficient in humus or where no considerable leguminous crops or residues have recently been plowed into the soil, the fertilizer constituents should be contained in the mixture in about the proportion of 7 per cent phosphoric acid, 7 per cent of nitrogen, and 5 per cent of potash. The nitrogen may be all derived from blood, tankage, cotton-seed meal, or similar products, or in part from one or all of these, and

in part (up to one-half) from nitrate of soda.

Kainit, manure salt, sulphate or muriate of potash may furnish the

potash, and acid phosphate the phosphoric acid.

Four hundred pounds of the above mixture would contain 28 pounds of available phosphoric acid, 28 pounds of nitrogen and 20 pounds of potash, and 1,000 pounds would contain 70 pounds of available phosphoric acid, 70 pounds of nitrogen, and 50 pounds of potash. The required amounts of phosphoric acid in 400 and 1,000 pounds respect-

ively of this mixture would be supplied by 175 pounds and 438 pounds of 16 per cent acid phosphate; the nitrogen by 215 pounds and 538 pounds of 13 per cent (N.) dried blood; and the potash by 100 pounds and 250 pounds of manure salt. Other materials or other grades of these same materials may be used, and it will not be difficult, knowing just what they contain, to use such quantities of them as will be necessary to furnish the quantities of plant food, having in mind that it is the specific number of pounds of phosphoric acid, nitrogen and potash that is desired, rather than a given weight of mixed fertilizer.

13. On a whole the results show that lime used at the rate of 1,000 pounds of slaked lime broadcast every two or four years has proven profitable in cotton growing, when the lime was used in connection with

an application of the normal fertilizer.

I. FERTILIZER EXPERIMENTS WITH COTTON ON THE SANDY LOAM SOILS OF THE COASTAL PLAIN

This is the fourth of a series of Bulletins giving the results of experiments to determine the fertilizer or plant food needs of different soil types of the State. The three previous reports issued as the June, August and September (1910) Bulletins of this Department, gave—

1. Results of Fertilizer and Variety Experiments with Cow Peas on

Piedmont Red Clay Loam Soil (June).

2. Results of Fertilizer Experiments with Cotton on Piedmont Red Clay Loam Soil; and Varieties, Culture and Fertilization of Cotton on Piedmont Red Clay Loam, Red Clay and Valley Soils (August).

3. Results of Fertilizer Experiments with Corn on Piedmont Red Clay Loam; and Variety Culture and Fertilization of Corn on Piedmont Red Clay Loam, Red Clay, and Valley Soils (September).

More attention is now being paid to the production of cotton than ever before in the history of the State and fertilizers are used more generally and in larger amounts on this crop than in former years.

WORK REPORTED.

Cotton is our leading money crop. More commercial fertilizer is used in fertilizing and growing this crop than any other. It responds readily and profitably to proper fertilization. Some ten years ago systematic experiments were begun to determine the fertilizer or plant-food requirements for the most economical production of cotton on our different cotton soils.

On the following pages are recorded the results of seven years' fertilizer and variety tests of cotton on the Edgecombe Test Farm of this Department, extending through the years 1903-1909 inclusive. The work is being continued to collect further data, when cotton is grown as it has been in the work here recorded, as well as in rotations with other staple crops and soil-improving crops.

LOCATION OF FARM AND CHARACTER OF SOIL.

The Edgecombe Test Farm is located near the center of Edgecombe County, on the main road between Tarboro and Rocky Mount, approximately eight miles from either place. It is two miles south of Kingsboro Station.

The main upland soil of this farm is representative of much of the Coastal Plain Section of the State. It consists of a dark gray sandy to fine sandy loam, eight to twelve inches deep, underlain by a yellow sandy clay subsoil. The surface soil is light in texture, and is commonly very deficient in organic matter. It classifies as Norfolk sandy to fine sandy loam. Like most of the sandy soil of the Coastal Plain, the sand content is mostly silica (quartz sand) which contains no important plant food. The chemical analysis of this type of land shows it to be universally deficient in nitrogen and phosphoric acid, and in

the southeastern part of the State, also in potash. The potash content is much higher in the northern part of the Coastal Plain Section; especially is this true northeast of Albemarle Sound. The soil of the Edgecombe Test Farm is between these two extremes, approaching the low rather than the high potash content. Consequently we could hardly expect the increase from the use of potash to be as great when used on this character of soil in the counties to the north of Edgecombe, but in those to the south its use should be accompanied with larger increases and greater profit. These light sandy soils are also deficient in lime. This deficiency is noticeable in the growing of legume crops. Bacterilogical investigations show this soil to be very deficient in beneficial bacterial life.

The following figures which are averages for several samples taken on the Edgecombe Farm show the chemical composition of the soil. They state the pounds of plant food per acre contained in the surface to the depth of six and two-third inches, and in subsoil to the depth of

twenty-eight inches.

	$Pounds\ in$	Pounds in
	Surface.	Subsoil.
	$6\frac{2}{3}$ inches.	$28\ inches.$
Nitrogen (N)	984	1,720

Potash (K_2O)	3,810	13,200
Lime (ČaŌ)	3,595	10,216

PLATS.

The plats on which the experiments were conducted were embraced in fields A and B. The farm on which all the plats are located has been in cultivation for a good many years. The experiments were started on field A in 1903 and on field B in 1905. The plats in field A were laid off in three parallel series of thirteen plats each with a turn row or driveway between each series. The plats are one-tenth acre in size or 217.8 feet by 20 feet, with an unfertilized space between plats sufficient for one row and a four-foot unfertilized space at the end of rows. Plats 1, 2, and 3 of the second series, and 1, 2, 3, 4, 5, 6, 7, and 8 of the third series of this field are somewhat inferior in fertility naturally to

the other plats of the field, due to surface washing.

The plats in field B were laid out in a similar way to those of field A, except that the plats in the third series were of one-twentieth acre size, but in the other two series they were of the same dimensions as those of field A. Another difference was that in field B provision was made for two rows between plats instead of one as in field A and these extra rows were fertilized like the plat nearest to them, but were not harvested and weighed with the plats. Work was started on field B in 1905 and a rotation of cotton and corn with field A was begun. Bur clover was sown on field B at the last cultivation of corn in 1908 and of cotton in 1909, but as the bur clover failed in 1909 the plats were seeded to crimson clover early in November and covered by a Planet, Jr., cultivator, going once to the row.

Field A.—The plats were used for fertilizer experiments with cotton in 1903-'04-'06-'08; and fertilizer experiments with corn in 1905-'07-'09. In case of each of the two crops the same plan or system of fertilization was followed. By this is meant that plat 8 in all cases received only nitrogen and potash, plat 9 only phosphoric acid and potash, plat 10 a normal application of potash, nitrogen, and phosphoric acid, and so on, though the quantities actually applied varied with the two crops. The fertilization of the cotton plats was based on a normal application of 400 pounds per acre of a mixture containing 7 per cent available phosphoric acid and 2½ per cent each of nitrogen and potash. The fertilization for corn was on a basis of 300 pounds per acre of a mixture containing 7 per cent available phosphoric acid, 3 per cent nitrogen, and 1½ per cent potash.

Field B.—These plats were used for fertilizer experiments with corn in 1906 and 1908 and for fertilizer experiments with cotton in

1905-'07-'09.

PREPARATION AND CULTIVATION.

The land in all cases was well prepared by breaking with a two-horse turning plow in the winter, usually January and February, to a depth of 8 to 10 inches, and allowed to remain this way until just before planting, when it was cut up thoroughly with a disk harrow. The rows were run off 31/3 feet apart, the fertilizer distributed in the drill and covered to a slight ridge, usually with one furrow of disk or other cultivator. This was done some time prior to planting, so as to give the ground time to settle before planting. Russell's Big Boll was the variety of cotton used in all the experiments. The cotton was planted as soon as the weather would permit in the spring, on the slight ridge made in covering the fertilizer, but which was usually brought to a level, or almost to a level, by the cotton planter. The cotton was well cultivated with weeders, harrows, single and two-horse cultivators, requiring not exceeding two furrows to row, making the cultivation deep at beginning and shallow toward the close of the season, when root development of the plants was well extended into the soil. The cultivation was repeated each ten days to two weeks during the season, the crop being laid by between July 15 and August 1, according to season. The crop was thinned as nearly as possible to one stalk in the hill every 15 inches.

FERTILIZATION AND FERTILIZER MATERIALS USED.

As already stated, the fertilizer was applied in the drill just before planting the cotton, the exact quantity of material for each row being weighed out separately so that each row would get its proper amount of the several fertilizer constituents. Acid phosphate was used as the source of phosphoric acid; dried blood as the source of nitrogen, except where there was a comparison of different nitrogen-furnishing materials, or where nitrate of soda was used as a part of the nitrogen; manure salt as the source of potash; and rock or builder's lime for lime. The fertilizer materials were analyzed each year and applications made on the basis of actual analyses, so as to give the exact quantities of nitrogen, phosphoric acid, and potash required for each plat. For the sake of simplicity and convenience in presenting the results of a number of

years' experiments, the fertilizer applications are expressed in terms of acid phosphate, containing 14 per cent available phosphoric acid, dried blood containing 13 per cent nitrogen, nitrate of soda containing 14.8 per cent nitrogen, and manure salt containing 20 per cent potash, which figures represent the average composition of these materials. The fertilizer applications in the fertilizer experiments are on the basis of 400 pounds per acre for the normal plat (N P K) of a mixture containing 7 per cent available phosphoric acid and 2½ per cent each of nitrogen and of potash. Lime is applied at the rate of 500 pounds of rock, builder's or burnt lime. The fertilizer applications in the tables, in addition to being represented in terms of acid phosphate, dried blood, nitrate of soda, and manure salt, are also expressed in terms of the symbols, N, P, K, and L, which have the following significance:

N equals nitrogen at the rate of 10 pounds per acre, or 77 pounds of 13 per cent dried blood;

P equals phosphoric acid at the rate of 28 pounds per acre,' or 200 pounds of 14 per cent acid phosphate;

K equals potash at the rate of 10 pounds per acre, or 50 pounds of 20 per cent manure salt;

L equals lime at the rate of 500 pounds rock or unslaked lime per acre.

There are columns in the tables showing the exact weights in pounds of phosphoric acid, nitrogen, and potash applied to each plat (expressed on acre basis), which will enable any one to use the same amounts of fertilizer constituents in other materials if desired.

The following average prices which fairly represent the cost of the several materials to the farmer for the period under experimentation

have been assumed for the materials used:

14 per cent Acid Phosphate	\$14.00 per ton.
13 per cent Dried Blood	60.00 per ton.
14.8 per cent Nitrate of Soda (18 per cent Am-	•
monia)	50.00 per ton.
20 per cent Manure Salt	20.00 per ton.
Rock Lime	10.00 per ton
MOCK LIMB	10.00 per ton.

The arrangements of the plats and the scheme of fertilizer application is shown by the following:

Normal fertilizer application, 400 pounds per acre of a mixture containing—

Phosphoric Acid	7 per cent.
Nitrogen	$2\frac{1}{2}$ per cent.
Potash	$2\frac{1}{2}$ per cent.

In this normal application—

N equals 10 pounds nitrogen, equals 77 pounds 13 per cent dried blood;

P equals 28 pounds phosphoric acid, equals 200 pounds 14 per cent acid phosphate;

K equals 10 pounds potash, equals 50 pounds 20 per cent manure salt.

The above represents the plats in field B. In field A and in "Old Field" they are arranged in a similar way.

Weather Conditions During 1900-'09, Inclusive.

Besides soil, seed, fertilization, and cultivation, and time of planting, weather conditions, mainly the rainfall, influence the crop yield. In the table presented herewith will be found the monthly and annual rainfall during the years covered by the experiments, the mean monthly and annual rainfall since 1868, and the same data for the months of May to September, inclusive. During the growing months the rainfall was

below normal in all years except 1909. In the years 1903-'04 and '06 this average was approximately an inch or more per month, but for the other three years, 1905-'07 and '08 the deficiency of rainfall during the growing season was only slight. The year 1905 was the only one in the period which had a total rainfall below normal.

RESULTS.

In studying the yields of the two fields it will be well to bear in mind that on fields A and B the rotation consisted of cotton and corn and that bur clover as a cover crop was not put on fields A and B until latter part of July in 1908. Field B was sown in bur clover in fall of 1909, but as this failed crimson clover was seeded uniformly over the plates early in November.

In the future, as during the past four years (1910-1913) the crops

will be grown according to the following rotation:

First year ... Cotton and Crimson Clover.
Second year ... Peanuts and Bur Clover.
Third year ... Corn and Cowpeas.

The cotton, peanut, and corn crops will be fertilized according to

the general scheme of conducting the fertilizer experiments.

The experiments were planned to cover the culture and fertilization of cotton as a whole, but the results of the several subdivisions or phases of the subject are grouped in short tables to facilitate examination and the drawing of conclusions, after which they will be considered as a whole and general conclusions drawn for the fertilization of the crop on this type of soil.

EFFECT OF NITROGEN, PHOSPHORIC ACID, POTASH AND LIME ALONE AND IN COMBINATION WITH EACH OTHER ON COTTON YIELDS.

The experiments, the results of which are presented in Table I, were planned to determine the effect on yield of cotton of different fertilizer applications when two of the constituents were applied together, as nitrogen and phosphoric acid (N P), nitrogen and potash (N K), and phosphoric acid and potash (P K), and when all three of the fertilizing constituents were applied to make a complete fertilizer (N P K); also to test the effect of lime (L) when used alone and when used in connection with a complete fertilizer (N P K L). The results are shown in yields of seed cotton per acre for the several years, average yields, average increases over the unfertilized (O) plats which represent the effect of the fertilizer applications, the value of increase, cost of the fertilizer, and value of the average annual increase over cost of fertilizer.

Nitrogen and Phosphoric Acid, N. P. (Plats 10^3 and 10.) Nitrogen and phosphoric acid gave increased yields over the unfertilized plats four of the seven years on the two fields, the annual average increase for the three years in field B being 288 pounds; for four years on field Λ an average loss of 9 pounds, or an average annual increase for seven years in the two fields of 167 pounds, worth \$3.81 over the cost of fertilizer.

Nitrogen and Potash, N.K. (Plats 8 and 8.) The application of nitrogen and potash combined gave large increased yields for all years except one. The average increase on field B was 630 pounds per acre, and 185 on field A. The average increase for the seven years was greater than that given by any of the other applications except complete fertilizer and lime. The average profit from this application was \$14.11 per acre.

Phosphoric Acid and Potash, P K. (Plats 9 and 9.) Phosphoric acid and potash combined gave a large average annual increase for the three years on field B—444 pounds—but for the four years on field A the average increase was only 46 pounds. This gives an average increase on the two fields of 217 pounds, worth \$9.77, which is \$7.87 more

than the cost of the fertilizer.

Phosphoric Acid. Potash and Nitrogen, NPK. (Plats 10 and 11.) These three materials combined in a complete fertilizer gave average increased yields in both fields. The average annual increase for four years on field Λ was 163 pounds of seed cotton; and for three years on field B, 593 pounds; or an average increase per acre for the seven years

of 348 pounds, worth \$11.45 over the cost of fertilizer.

Lime, L. (Plats 63 and 53.) For the four years on field A the lime plat showed an average annual loss of 56 pounds of seed cotton, representing a financial loss of \$3.15. On field B however, this material gave an increase each of the three years, averaging 218 pounds more than the unfertilized plat, and the profit was \$9.18. As an average of these two apparently contradictory results lime gave an average increase of 62 pounds, representing a profit of \$2.16.

Lime with Complete Fertilizer, N P K L. . (Plats 73 and 63.) With the exception of the year 1905 on field B, lime in combination with the

three fertilizer constituents gave a larger yield of cotton than did complete fertilizer without lime. The average yield for the seven years from this treatment was 142 pounds greater than for complete fertilizer without lime. The profit, \$17.62, is greater than that from any of the other fertilizer combinations.

Taking the experiments as a whole the average results show that: The combination of nitrogen and phosphoric acid gave the smallest

increase and also the least profit.

That nitrogen and potash gave an average yield of 209 pounds more seed cotton than did the nitrogen and phosphoric acid treatment, with a profit of \$14.11.

Phosphoric acid and potash gave a slightly greater yield than nitrogen and phosphoric acid, but not nearly as great as nitrogen and potash.

Nitrogen, added to phosphoric acid and potash, making a complete fertilizer, increased the yield 131 pounds, and gave an additional profit of \$3.58.

The results from lime alone, while contradictory on the two fields, show a slight average increase and a profit of \$2.16. In addition to complete fertilizer, lime shows an increase of 151 pounds of seed cotton, and its application here was at a profit of \$6.17, and for complete application—N P K L—the profit was \$17.62.

The main increased yields and profits came from the use of nitrogen and potash. On the whole, practically no great beneficial effect was seen from the phosphoric acid application. The application of line was

in general, accompanied with some profit.

EFFECT OF VARYING QUANTITIES OF NITROGEN.

These tests (Table II) were planned to determine the effect on the yield of cotton of varying quantities of nitrogen, leaving the phosphoric acid and potash constant. On one plat the nitrogen was reduced to one-half of the normal quantity, making the application 5 pounds of nitrogen per acre or practically 11/4 per cent in the fertilizer mixture. On two of the plats it was increased by 2 and 3 times the normal quantity (10 pounds per acre), making the application 20 and 30 pounds per acre respectively, or on basis of the fertilizer mixture 5 and 7½ per cent. The average results for both fields show the largest yield and profit from the fertilizer application containing three times normal or the largest quantity of nitrogen in the several mixtures. The three times normal application which represents a fertilizer analyzing 7-71/2-21/2 gave an average annual increase of 784 pounds of seed cotton, a profit of \$26.45 over the cost of fertilizer. With the exception of the two and a half times normal application this represents the largest profit.

These results indicate as they do those with corn, that nitrogen is one of the controlling constituents, if not the most important one for crop

production on this soil.

EFFECT OF VARYING QUANTITIES OF PHOSPHORIC ACID.

The above experiments (in Table III) were planned to show the effect on the yields of seed cotton of varying quantities of phosphoric acid, the nitrogen and potash remaining the same. On one plat one-half the normal quantity of phosphoric acid was applied, or an amount represented by 100 pounds of 14 per cent acid phosphate and equivalent to $3\frac{1}{2}$ per cent phosphoric acid in the fertilizer mixture. On two plats were applied two and three times the normal quantities of phosphoric acid, represented by 400 and 600 pounds of 14 per cent acid phosphate

respectively, or 56 and 84 pounds of phosphoric acid per acre.

Varying the amounts of phosphoric acid had no very marked effect on the yield of cotton. The application of more than normal—28 pounds per acre—which is equal to an application of 200 pounds of 14 per cent acid phosphate failed to increase the yield, and consequently gave less profit. However, when the amount was reduced to one-half normal both yield and profit were less. It is well to remember in this connection that nitrogen and potash alone (see Table I) gave a larger yield and greater profit than did any of the mixtures containing phosphoric acid. These results certainly indicate that the application of phosphoric acid in the form of acid phosphate is not accompanied with much profit.

Effect of Varying Quantities of Potash.

The experiments reported in Table IV were arranged to show the effect on the yield of seed cotton of varying quantites of potash, the nitrogen and phosphoric acid remaining constant. On one plat only one-half the normal quantity of potash was applied, or 1½ per cent in the fertilizer mixture, or 5 pounds of potash per acre, while on two other plats two and three times the normal quantities were given, or 20 and 30 pounds of actual potash per acre respectively. On basis of the normal fertilizer mixture this would represent 5 and 7½ per cent of

potash in the mixture.

The yield of cotton on Plat 1², field B, which received one-half normal potash is abnormally high. With this exception, increased amounts of potash gave increased amounts of cotton on this field. However, the increase on field B from the application of three times normal—30 pounds—over twice normal—20 pounds—was not enough to pay for the additional fertilizer. For the four years' average on field A, increased amounts of potash gave increased yields and small increased profits. In general it appears that with cotton increasing amounts of potash can hardly be expected to much more than pay for themselves.

Effect of Varying Quantities of Fertilizer on Yields.

The experiments in Table V were planned to show the effect of increasing and decreasing the normal (N P K equals 400 pounds of a fertilizer mixture containing 7 per cent phosphoric acid, 21/2 per cent potash and 2½ per cent nitrogen) fertilizer application on the yields. The applications were at the rate of 200 pounds per acre (½ N P K); 400 pounds per acre (N P K); 600 pounds per acre (1½ N P K); 800 pounds per acre (2 N P K); and 1,000 pounds per acre (2½ N P K); The results on several fields and the averages of the two fields are quite uniform in showing increased yields and increased profits for the several increases in the amounts of fertilizer, the quantity of fertilizer per acre varying from 200 to 1,000 pounds. The largest yields, as well as the greatest profit, were obtained from the 1,000-pound application. It is possible that the limit of the most profitable fertilization for cotton on this soil has not been reached, and that more than 1,000 pounds per acre would give remunerative returns. It should be remembered, too, in this connection, that the composition of this mixture is not especially adapted to this soil, as shown by results in previous tables. A larger per cent of nitrogen would certainly have increased the yields and very probably the net profit.

In addition to larger profits from heavy fertilization of the right kind, the land is in all probability improving in productiveness and value. Results on these plats and fields in after years will be most valuable in throwing light on this most important phase of the proper fertilization for immediate returns and for the permanent improvement of the soil. This latter phase of farm practice is not given the thought and consid-

eration it should receive by most farmers.

EFFECT OF DIFFERENT MATERIALS FURNISHING NITROGEN AND TIME OF APPLICATION.

The experiments, the results of which are presented in Table VI, were arranged to test the comparative value of dried blood and nitrate of soda as nitrogen-furnishing materials in growing cotton, as well as the best

way of applying these.

Nitrate of soda is a material easily soluble in water and therefore quickly available for the use of plants. The questions usually raised in connection with its use are the possibility of its loss from the soil, especially sandy or open, porous soil, because of its easy solubility in water and its giving out before a long-seasoned crop has made its growth, thus leaving it without a supply of nitrogen before the end of the growing season. Its use is most strongly advocated for short-season crops, as in early truck and vegetable growing, and as a top dressing for grain and for corn and cotton after growth is well advanced, or for any crop when seen to be in need of a quickly-acting nitrogen-supplying material.

Dried blood, which is a fair representative of the animal and vegetable materials furnishing nitrogen, as cotton-seed meal, tankage, etc., is not soluble in water and acts more slowly and for a longer time. It must be changed by rotting or decomposing in the soil into nitrates before it can feed the crop, and is thus likely to be effective throughout a reason-

able growing season.

It has become a practice in growing many crops to apply only a part of the nitrogen at the time of planting and a portion later, usually as nitrate of soda, so as to keep the crop growing as rapidly as possible. The tests in Table VI were planned with a view of throwing as much light as possible on these questions of nitrogen fertilization. In the experiments all of the phosphoric acid and potash were applied in the drill before planting. On plats 112 and 92 one-half the nitrogen was supplied as dried blood and was applied with the phosphoric acid and potash before planting, and one-half the nitrogen was supplied as nitrate of soda and applied about July first. In plats 122 and 102 all of the nitrogen was furnished by nitrate of soda, one-half being applied before planting, with the phosphoric acid and potash and the other half about July first. On plats 13² and 11² the nitrogen was supplied by dried blood, one-half being applied before planting, with the phosphoric acid and potash and the other half about July first. On plats 13 and 122 four-fifths of the nitrogen was furnished by dried blood and one-fifth by nitrate of soda and was all applied before planting, along with the phosphoric acid and potash.

It is evident that there is considerable variation in the different years and on the different fields. In studying these results it is only fair to practically disregard plat 1³, field A, for it is naturally much less fertile than the check plat of the same series—8³. With this exception the average table shows no marked difference in profit favoring any single method of application. On the average, two applications of nitrogen, one-half at planting and one-half about July 1, gave the largest increase and profit. Considering the results on field B alone, and this probably

is more accurate than the average (on account of the lack of uniformity in field A), two applications of the nitrogen in all cases gave larger profit than the single application either applied in the drill before planting (plat 11) or broadcasted (plat 73). From the data at hand it hardly seems safe to draw any definite conclusions in favor of either method. Taking into consideration the results from similar treatments on the Iredell Test Farm (see August Bulletin, 1910, No. 139), it appears that the dried blood and nitrate of soda are about equally satisfactory sources of nitrogen, the choice between them depending largely on market prices, and that very little extra profit can be expected by making two applications of the nitrogen when the total amount is not over ten pounds per acre. In larger amounts a second application may prove profitable.

*The fertilizer was applied in the drill before planting on this plat.

Fertilizer on this plat applied one-half in drill before planting and one-half as side dressing about July 1.

Fertilizer on this plat applied broadcast before planting.

EFFECT OF DIFFERENT METHODS AND TIME OF APPLICATION OF FERTILIZER.

The results presented in Table VII were obtained from experiments planned to show the effect on yield of seed cotton from applying—

(a) All the fertilizer in the drill before planting;

(b) Dividing the fertilizer into two equal parts, applying one-half in the drill before planting and the other half as a side dressing about July first; and

(c) From applying all of the fertilizer broadcast before planting, the quantity of fertilizer and the materials entering into it being the same

in all three eases.

Taking the results as a whole, the increased yields and profits show that it has made very little difference whether all of the fertilizer was applied in the drill before planting, or whether it was divided into two equal parts and one-half put in the drill before planting and the other half applied as a side dressing about July first, according to season. The double application gave the largest yield and profit, the drill application before planting slightly less, and the broadcast application a still smaller yield and profit. These differences are hardly sufficient to warrant any definite conclusions in favor of one method above another.

II. VARIETIES, CULTURE AND FERTILIZATION OF COTTON ON SANDY LOAM SOILS OF THE COASTAL PLAIN

Seven years' fertilizer and variety experiments have been conducted on the sandy loam soil of the Edgecombe Test Farm. On a lasis of these results and other information which we have, the suggestions below are given for the culture and fertilization of cotton on the sandy and sandy loam soils of the Coastal Plain section, and the varieties of cotton which are best suited to them.

Cotton is not a hard or exhaustive crop on the soil, when the soil and crop are handled with care and intelligence. A bale of cotton (900 pounds of seed and 500 pounds of lint) removes from the soil in round numbers:

30 pounds Nitrogen,

12 pounds Phosphoric Acid, and

13 pound Potash,

worth at present prices of fertilizer ingredients \$7.20. Only 48 cents worth of this is carried away in the lint. The seed can be sold for enough to return in commercial fertilizer considerably more plant food than the lint and seed took from the soil. The stalks, leaves, and bolls, which should never be burned or otherwise removed, and 95 per cent of which have come from the air, add vegetable matter or humus to the soil. If the land is liberally fertilized in the right way, well drained and protected from surface washing, it should continue to produce large and profitable crops of cotten from year to year, and with a good rotation and profitable fertilization will increase in fertility and productiveness. None of our other staple crops are as easy on the soil as is cotton when handled in the way indicated above.

Preparation and Cultivation.—The land should be thoroughly and well prepared by breaking in the fall or early spring to a depth of 6 or 8 inches, and the soil may be gradually deepened beyond this for a few inches to advantage. Before planting, cut up well with a disk harrow to get rid of clods and to make a good seedbed, and run off rows 3½ to 4 feet apart, and on very fertile land 41/4 feet. As a rule, the fertilizer should be put in the drill before planting and the cotton planted on a level or just above the level, according to the season and drainage condition of the land. Weeders and light harrows may be run across the rows two or three times before and after the cotton is up and before cultivation with cultivators and hoeing begins. When the crop is well up and danger of frost is over, hoe and thin to a stand of 15 to 20 inches in the drill, leaving as nearly as possible one stalk in a place, and giving greater distance in the row and between rows as the productiveness of the land increases. On thin land the rows should be closer together and 'the cotton closer in rows, as the stalks do not grow very large; but distance should be given both ways as the land increases in productiveness, from whatever cause brought about. Cultivate with good one or two-horse cultivators, which will not require more than two furrows at greatest to the row, every ten days to two weeks and as nearly as possible after rains to keep down grass and weeds and to conserve the supply of moisture. The cultivation should be comparatively deep early in the season, becoming shallow as the crop grows and the root system develops. Ordinarily cultivation should be continued in the Coastal Plain section of the State until July 15, or later.

Varieties.—Up through 1909 sixty-seven varieties of cotton have been tested on the Edgecombe Farm, a number of these running through the entire period. Generally the later maturing varieties of the big boll type have given the largest returns, though now and then, with a short growing season, the small boll, early maturing kinds have stood well.

Among the varieties which have done well are:

Medium to Large Bolled Varieties—

Russell's Big Boll. Culpepper's Improved. Cleveland's Big Boll. Cook's Improved. Brown's No. 1. Peterkin's Improved.

Small Bolled Varieties—

King's Improved. Hodge. Webb. Broadwell's Double-Jointed. Sugar Loaf.

The results of variety tests have been published each year and are summarized in the *February* (1909) *Bulletin*. These results can be had

for study by any one specially interested in them.

Fertilization.—Analyses of these soils show that they are very low in nitrogen and phosphoric acid and only fairly well supplied with potash and lime. Experiments show that nitrogen is the most needed constituent for the production of cotton, but that profitable results are secured from the use of materials carrying potash and phosphoric acid. The aim of the farmers on the Coastal Plain soils of the State should be to supply as great amount as possible of the nitrogen requirements of his soil by establishing rotations in which leguminous crops come into the rotation at as frequent intervals as practicable. As many of these crops or crop residues should be plowed into the soil as possible to provide as nearly as possible the requisite amount of nitrogen for other crops in the rotation, and also to store the soil with plenty of organic matter in order to maintain the soil in a good physical condition. Where commercial fertilizers are depended upon largely to supply the nitrogen and other plant food constituents, it is not possible, with the present results, to say just definitely what is the best proportion of these three constituents for most profitable returns, but it is certain that the fertilizer should carry a much higher percentage of nitrogen than has been used heretofore, if the soil is not well stocked with organic matter, and that the phosphoric acid may be decreased. The indications are that for the average soil of the Coastal Plain a mixture containing about 7 per cent of available phosphoric acid, 7 per cent of nitrogen and 5 per cent of potash will give close to if not the best results. This mixture should be used for best results at the rate of at least 400 pounds per acre, and as much more as one can afford up to 1,000 pounds.

The nitrogen may be all derived from blood, tankage, cotton-seed meal, or similar products, or in part from one or all of these, and in part

(up to one-half) from nitrate of soda or sulphate of ammonia.

Kainit, manure salt, sulphate or muriate of potash may furnish the potash, and acid phosphate the phosphoric acid. Four hundred pounds of the above mixture would contain 28 pounds phosphoric acid, 28 pounds of nitrogen and 20 pounds of potash, and 1,000 pounds would contain 70 pounds phosphoric acid, 70 pounds of nitrogen and 50 pounds of potash. The required amounts of phosphoric acid in 400 and 1,000 pounds respectively of this mixture would be supplied by 175 and 438 pounds of 16 per cent acid phosphate; the nitrogen by 215 and 538 pounds of 13 per cent dried blood, and the potash by 100 pounds and 250 pounds of 20 per cent manure salt. Other materials or other grades of these same materials may be used, and it will not be difficult, knowing just what they contain, to use such quantities of them as will be necessary to furnish the required amount of plant food, having in mind that it is the specific number of pounds of phosphoric acid, nitrogen and potash that is desired, rather than a given weight of mixed fertilizer.

It is not more, but perhaps less difficult to calculate the number of pounds of nitrogen, phosphoric acid, and potash to be applied per acre to any given crop from materials which are to be had than to estimate the exact number of pounds of materials to make a formula of a certain composition; as, for example, in an 8-2-2 goods. The question of filler does not have to be considered in doing this, as is necessary in making a fertilizer formula in the usual way. When it is desired, for instance, to apply the equivalent of 400 pounds per acre of a fertilizer mixture containing 7 per cent of available phosphoric acid, 7 per cent of nitrogen and 5 per cent of potash, or 28 pounds of phosphoric acid, 28 pounds of nitrogen, and 20 pounds of potash, it is only necessary to divide the number of pounds of plant food desired per acre (28, 28, and 20) by the percentage composition of the materials to be used, as follows:

Number of Pounds of Plant Food per Acre Wanted	÷	Percentage Composition of the Materials to be Used	=	Number of Pounds of Fer- tilizer Materials per Acre to Apply
Phosphoric Acid	÷	13% Dried Blood	= = =	175 Pounds. 215 Pounds. 100 Pounds.

With cotton planted on the coarse sandy or fine sandy loam soils of the Coastal Plain section of the State, which have open or only moderately retentive sandy clay subsoils, it has generally been found most profitable to divide the whole fertilizer application into two parts, putting in one-half in the drill at planting and reserving the other half to be applied alongside the row as a side dressing about July 1. However, instead of this, if the soil is not of too open a nature, all the phosphoric acid and potash with one-half of the nitrogen in the form of cotton-seed meal, dried blood, or some other form of available organic nitrogenous material may be put in at planting of the cotton and the remaining half of the nitrogen reserved to be applied in a more immediately available form, like nitrate of soda, alongside the rows about July 1, after the plants have gotten well started in their growth and the roots have fairly well filled the soil.

LETTER OF TRANSMITTAL.

Hon. W. A. Graham, Commissioner.

Sir:—I submit herewith manuscript for a Bulletin on "Insect Enemies of Corn." Corn is our most important crop, and the total damage done to it by insects is enormous. The Bulletin which we issued upon this subject in May, 1905, has been exhausted, and the matter which it contained has here been rewritten to include later observations and to avail ourselves of many excellent publications on corn insects which have recently appeared from other States, thus bringing, so far as I am able, the best present information into shape available to our farmers. The general plan of the older Bulletin has been retained, as also the illustrations.

I recommend its publication as the Bulletin for May, 1914. Very respectfully,

FRANKLIN SHERMAN, JR.,

Approved for printing:

Entomologist.

W. A. GRAHAM,

Commissioner.

Conclusion	56

INSECT ENEMIES OF CORN.

By FRANKLIN SHERMAN, JR., Entomologist.

INTRODUCTION.

Nearly one-half of all the land planted in crops in North Carolina each year is devoted to corn. The yearly money value of the total crop is estimated at \$70,000,000.

Insects are estimated to destroy approximately one-tenth of the total value of our crop products. Allowing that corn suffers its proportional share, we are brought to the conclusion that the corn crop in North Carolina suffers an average loss of \$7,000,000 per year from insect pests.

Nor can it be said that this is an exaggerated estimate. What with wire-worms, cut-worms, bud-worms, bill-beetles, stalk-borers, chinch-bugs, ear-worms, weevils, and others, the corn plant certainly seems to suffer its full one-tenth loss. The writer has frequently known of cases in this State where one species of pest alone has destroyed from one-half to three-fourths of the entire crop; a total loss has been reported in some instances. Injury by insects frequently makes replanting necessary, and this is always a serious loss of time, labor, seed, and use of land. Putting the matter in its mildest light, the loss certainly runs well up among the millions.

The object of this Bulletin is to show how and where these losses occur, to describe the insects responsible for them, and set forth the remedies or methods which may be employed in preventing or avoiding these injuries.

A Bulletin on "Insect Enemies of Corn" was issued in May, 1905,* but the edition has been exhausted. The continued demand for information about corn insects makes a new issue desirable. The work of the county demonstration agents, the boys' corn clubs, the teaching of agriculture in many of our public schools, and many other commendable factors, have all increased the interest in the corn crop, and in the enemies which attack corn.

In the present Bulletin the descriptions of the insects and the account of injuries in North Carolina are based on our own observations, correspondence, etc. The accounts of life-histories, remedies, etc., are gleaned from all available reliable sources, including text-books, bulletins, etc., as well as our own observations. A great work yet lies ahead in the working out of the exact, detailed life-histories of our Southern corn insects and in determining with exact, scientific accuracy the degree of

^{*}Vol. 26, No. 5, Bul. N. C. Dept. Agr., May, 1905, "Insect Enemies of Corn." F. Sherman.

protection that can be secured from them. The most that we can pretend to do here is to present the general facts, with such recommendations for control as seem, from present even incomplete evidence, to offer the best hope of relief. The illustrations are the same as in the previous Bulletin.

GENERAL CONSIDERATIONS.

In dealing with insect pests on corn, it must be constantly remembered that the crop is of relatively low commercial value, the margin of actual profit is small, hence expensive measures are not justifiable except in limited areas where their use will prevent the insects from spreading over larger areas. It may not be profitable to spray a whole cornfield to kill insects, yet the spraying of a few rows or a certain portion of the field may be profitable if by that means the pest can be prevented from spreading farther. The small margin of profit on the crop as a whole renders it difficult or impossible to combat some of the pests satisfactorily.

Again, corn is grown on such large areas and there are so many individual plants in a field that the treatment of each individual plant is

usually out of the question.

Therefore, in combatting many of the insect pests of corn we must rely on such methods of culture and handling of the crop as shall render it least liable to injury; in other words, the treatment must be preventive rather than curative—and this frequently necessitates taking the insects into account before the crop is planted, even in the very selection of the lands where it is to be planted, or, in severe cases, even modifying the manner of rotation of the crops which shall precede the corn. How far one is justified in going in recasting the plan of his farm operations to protect his corn from injury will of course depend upon how severe the injury is, and upon the value which he places upon the corn crop itself.

CULTURAL CONSIDERATIONS.

By changing or modifying the methods of culture much may be done to avoid insect injury. This is so important that we will consider it in more detail.

Rotation.—Any system by which corn follows grass or a growth of weeds is injurious, from the standpoint of insect pests. Where land just from sod is put in corn, the crop suffers more from wire-worms, white grubs, root web-worms and cut-worms than it does when it follows a cultivated crop like cotton. Suppose we have a field now in sod which we wish to bring into cultivation: A system of rotation which will give the minimum amount of insect injury to the corn might be arranged as follows: First year, plant the field in a small grain, and after that in peas. Second year, cotton, potatoes, cabbage or other cultivated crops.

Third year, corn (peas may also be grown with the corn). Fourth year, small grain and peas again, and so on. A shorter system may be used, but it is best to have corn at least two years removed from a growth of grass or weeds, and it is advisable to have it separated from small grain by one year in a cultivated crop. Of course such a plan may not always be feasible, but it is best so far as avoiding insect injury is concerned, and the nearer we can come to it the better. The employment of peas in the rotation is beneficial from all points of view. Not only do they tend to improve the land, but they do not in any way render the corn more subject to insect injury.

Corn following corn year after year is also favorable to the increase of certain insects (stalk-borers), and a two-year rotation with merely cotton and corn is favorable to some pests, especially ear-worm and rootlouse. Hence, while corn and cotton may follow each other occasionally, they should not always do so, and they should at least sometimes be separated by some other crop between them so as to interfere with those pests which feed on both cotton and corn.

Fertilization.—A crop of corn which has been put into healthy condition by fertilization, whether by commercial or farm manures, is better able to withstand and recover from insect attacks than one which has not been so aided. Here the peas serve a useful purpose. It has also been claimed that where heavy applications of kainit or other salty fertilizers are used the wire-worms, cut-worms and other underground insects are checked to a considerable extent.

Fall or Winter Plowing.—As a general rule, it may be poor policy to plow land in the fall and leave it bare all winter. If, however, a field which is in sod is to be planted in corn it will be well to adopt this method of fall plowing in order that the wire-worms, cut-worms and other soil-inhabiting insects may be starved out, killed by exposure, or driven away, before the crop is planted in the spring, especially if these pests are known to be usually destructive in the locality. The plowing should be deep, so as to thoroughly break up and pulverize the soil.

Time of Planting.—This has an important bearing on the amount of insect injury that the corn will suffer later on. Corn planted late is not so much hurt by either cut-worms or stalk-borers. In the eastern part of the State some good farmers claim that corn planted very early will often partially escape the bill-beetle (not always nor completely). In the eastern section also, very early (or very late) planting may avoid part of the injury by bud-worms; while in the western half of the State late planting of corn seems to be the best method of escaping bud-worms.

Planting Increased Quantity of Seed.—Injury by some insects, such as wire-worms, white grubs, bud-worms, and cut-worms, may occur largely before thinning time (especially if the corn is planted late), so that if

an extra quantity of seed is planted a stand may be secured even if some is destroyed by insects. Any surplus that remains can then be gotten rid of by thinning. There used to be a commonly quoted rhyme in this connection:

"One for the cut-worm,
And one for the crow,
One grain to rot, and
Two grains to grow."

The idea here is the planting of extra seed so that there will be a stand left in spite of poor germination and damage to the young stalks. This is a very simple expedient, though it does not in any way decrease the number of pests.

Cultivation.—Frequent and thorough cultivation of the soil not only stimulates the corn to a better growth, but acts as a decided check to cut-worms, wire-worms, root-lice, and other insects living in the soil. The cultivation can be more thoroughly practiced when corn is planted in checks, so that it can be cultivated both ways, than when the ordinary method is used.

Selection of Lands.—Wire-worms and bud-worms are worse in low-lands. It should be remembered, therefore, that when other considerations do not interfere, it may be well to avoid the very low situations.

Disposition of Remnants.—Throughout the southern states it is a common custom to "pull" the fodder, leaving the stalks standing in the field, often with the shucks attached, until the land is needed for other purposes, when they are beaten down and plowed under. Such a practice is detrimental from the standpoint of one who wishes to avoid insect injury. If the fodder were cut at the ground (or as close to it as practicable) and the stalks and leaves shredded or made into ensilage, a reduction of insect injury should result, and the value of the fodder and grain would both be increased by the process. Many insects find hibernating places in these stalks and husks. Chinch-bugs, grain weevils, and stalk-borers are all favored by this custom of "pulling" and leaving the stalks, and all will be more or less reduced by abandoning the custom and making use of the shredder and the silo. Even the plowing out, raking together and burning of the stubs will sometimes be advisable.

In some of our extreme northeastern counties it is the regular practice of many farmers to burn the stalks, under the idea that this destroys bill-beetles; but we question the advisability of this, for the land needs the humus of the stalks. If the stalks be cut and fed as fodder or ensilage and the remaining *stubble* be plowed out, raked together and burned, the whole result, in our opinion, would be better.

Ideal System to Avoid Insect Injury.—Having gone into some detail with these cultural considerations, it is well now to summarize with a

statement of the system to be followed if one aims to incur the minimum amount of insect damage to his corn crop:

The field should be on land well drained and of sufficient elevation not to be subject to overflow. It should be at least two years out of sod, and the year previous to corn should have been in some hoed or cultivated crop. If there is much growth of weeds or grass on the land, it should be plowed in the fall. The land should be deeply plowed, thoroughly prepared. The time of planting may be modified according to location and severity of insect pests, as already discussed. The young corn should be given frequent and thorough cultivation. At harvest the stalk should be cut at the ground and shredded or made into ensilage; the remaining stubble can be plowed out, raked together and burned.

The writer understands perfectly that such a system as this cannot always be carried out in all details, but he does claim that such a system will involve a minimum of insect risk, and the system is closely in accord with the best farm practice.

REGARDING INSECTS AND THEIR NAMES.

In considering the corn insects in this Bulletin, we have confined the main discussion to those which have actually been known to do serious injury to corn in this State; the lesser pests are discussed briefly.

In discussing each pest, we have given both the popular (common) and scientific names of the species, and have indicated the *order*, and under the order the *family* of insects to which each belongs. This makes for accuracy and definiteness. It should be remembered that the *Order* is the more comprehensive group, and that each order is divided into a number of *Families*.

The great majority of our insects fall into seven orders, and there are some ten or twelve other smaller and less important orders. These seven principal orders are:

- 1. The Orthoptera (Or-thop'-te-ra), including the Grasshoppers, Katydids, Crickets, Roaches, etc.
- 2. Hemiptera (He-mip'-te-ra), Bugs, such as Chinch Bug, Squash Bug and Terrapin Bug, Plant-lice and Scale-insects.
 - 3. Neuroptera (Neu-rop'-te-ra), Lace-wings, Dobsons, etc.
 - 4. Lepidoptera (Lep-i-dop'-te-ra), Butterflies and Moths.
- 5. Diptera (Dip'-te-ra), the true two-winged Flies, such as House-flies, Mosquitoes, Blow-flies, Horse-flies, etc.
- 6. Coleoptera (Co-le-op'-te-ra), Beetles, such as Potato-beetle, Bill-beetle, Flea-beetle, June-beetle, Tumble-beetle, Tiger-beetle, etc.
 - 7. Hymenoptera (Hy-men-op'-te-ra), Bees, Ants and Wasps.

Of these seven orders the Neuroptera, Diptera and Hymenoptera contain no very serious pests of corn, but all the others will be found referred to in the following pages.

It is believed that this arrangement will be of use to those who are interested in learning how to recognize the different orders of insects, and to all readers who wish to make their knowledge exact.

INSECT ENEMIES OF CORN.

WIRE-WORMS (Several Species). Order Coleoptera. Family Elaterida. (Also sometimes called "Drill-worm.")

Description.—Slender, smooth, firm-bodied, yellowish-brown worms (larvæ), attaining length of one to two inches, which destroy the corn by eating the seed before it comes up, or by eating roots, or into the stalk just below the surface of the ground, causing the center of the growing part to die. The adult insect is a "Jack-snapper."

Injury in North Carolina.—Any insect which does its work underground is not likely to attract attention except in cases of serious injury; hence the complaints made of these pests cannot be an adequate measure of the damage done by them. It is quite certain, also, that farmers often confuse injury by Wire-worms with that done by budworms, so that what is attributed to one may in reality be due to the other.

From the letters of complaint which have come to us in regard to Wire-worms, we give the following quotations, all of which throw some light on the nature or extent of damage or the habits of the insects:

"It gets in the root of the corn and kills it at any age from time it comes up until a foot high. In a 20-acre field I believe they have killed 14 per cent, and are still killing. They do most damage in lowlands."

"A yellow worm works in the roots and kills the corn in low wet land."

"Very destructive to corn on black lowlands. They attack the corn from the root and go up the pith and kill it entirely."

"Destroying the corn in this county before it gets out of the ground; my bottom-land is thoroughly infested. Many of my neighbors are in the same position as I am."

"Damaging corn in meadow after sod."

"Present by the bushel in a piece of my land this year."

It is not to be inferred that Wire-worms attack only corn. They feed on roots of many plants, also on seeds and tubers. One correspondent sent an irish potato which had been bored through and through by them. Some feed mainly or exclusively in decaying vegetation, rotting wood, etc. In this State they are a recognized tobacco pest.

While on a tour through the Piedmont counties to inspect wheatfields in the middle of April (1905), the writer several times noted more or less injury to wheat by Wire-worms. No doubt corn sown on similar land suffered in the same way, only in *greater degree*, since the number

of corn plants is small compared with wheat and the injury would be more concentrated. The following extracts from my notes on this trip will be of interest in this connection:

Greensboro, April 11, 1905.—Noted injury to wheat by Wire-worms eating off stem and roots at and near surface of ground. Noted at several places, though never serious.

Lexington, April 12, 1905.—In one field found very considerable injury by Wire-worms. Land had previously been in broom-sedge, as evidenced by tufts of sod in the field.

Statesville, April 13, 1905.—Noted some injury.

On April 20 (1905) the writer went to Warren County to investigate a Wire-worm outbreak. The infested field was a fine piece of meadow-land, reclaimed from swamp by drainage, and was cultivated (to corn) the year before for the first time, when Wire-worms destroyed practically every stalk. During the summer the land grew up in grass and weeds again and was not plowed until spring, when the soil was found to be still badly infested. The larvæ were still to be found in almost any foot of soil examined; they were apparently of different ages, some about full-grown. No pupæ nor adults were found.

Fig. 1.—Adult and larva of Wire-worm. It is the larva or worm form that does the damage. The adult beetle is known as a "Jack-snapper" and does no harm other than to lay the eggs.

(After Comstock and Slingerland.)

There are many species of Wire-worms, and though the kinds cannot always be distinguished in the Wire-worm stage, yet of the adult beetles over seventy species are already known to occur in North Carolina, and there are probably as many more not yet on record. But it is probable that only a few of our species are seriously destructive.

In June, 1911, a correspondent sent adult beetles of Wire-worms and said they were doing serious injury to his corn, but his description fitted the work of the Wire-worms themselves. No doubt the larvæ were still doing injury, but some were coming out in the mature beetle form, and it was these which he found.

Life-history.*—Wire-worms are the young, or larvæ, of the beetles which are called "Jack-snappers," "Snap-jacks," "Click-beetles," "Hominy-beaters," "Elaters," "Thumping-beetles," and other similar names. The beetles have these names because of their power to spring suddenly into the air when placed on the back.

^{*}Much of what is known of exact life-histories of Wire-worms comes from the work of Dr. Forbes in Illinois. (Bul. 44, Ill. Exp. Sta., "Ins. Injuries to Seed and Roots of Corn," May, 1896.) Extensive experiments are also reported by Professors Comstock and Slingerland of the N. Y. (Cornell) Exp. Sta.

The following account will give a general idea of the history of those species that attack corn, the details probably varying somewhat in the different species:

Many of the adult beetles pass the winter in dead wood, under bark, under trash, boards, leaves, at the base of tufts of grass, etc. In the summer they lay eggs, usually depositing them in grassy places. The larvæ hatching from the eggs are slender, smooth, yellowish-brown in color and firm in texture, and are called "Wire-worms." They burrow through the soil, feeding on various seeds and roots which they may find. It is thought that it takes most species from two to three years to reach maturity. Then they change to the stage known as the pupa in a cell in the soil. While in the pupa state they are quiet and take no food, but are going through the change from larvæ to adult beetles. After a few weeks in the pupa state the insect changes to an adult beetle. Some of the beetles emerge and pass the following winter in sheltered places; others do not emerge until the following spring.

Summary.—It will be noticed from the foregoing account that Wireworms are more destructive on lowlands, and that they are worse on lands which have been in sod. They feed on seeds, roots, and stems. It is probable that they do not attack corn or other cultivated crops because they especially like them, but because when sod lands are broken up they are already in the soil, their natural food is destroyed, and they must take what is planted. It takes from two to three years for a generation to reach complete maturity, and adults deposit eggs mainly in sod lands. With these facts in mind, we can better appreciate the recommendations which follow.

REMEDIES.

The first consideration in attempting to avoid injury to corn by Wireworms is not to allow corn to follow directly after sod. If corn must follow sod, plow the land in the fall and stir once or twice during the winter. These measures will starve and kill by exposure many of the larvæ and will break open the little cells in which the newly formed adults are passing the winter and kill the insects. By avoiding low lands (especially low sod lands) much injury will be averted. Good fertilization and frequent tillage will also check the insects or enable the corn better to recover from their attacks.

In regard to corn after sod, it should be remembered that most species of Wire-worms are thought to take two or three years to become full-grown, hence it is well to have the land in some other crop not so subject to injury during the first year from sod, so that the majority of the insects will have had time to mature and deposit their eggs elsewhere.

But Dr. Forbes in Illinois states that they "are much more likely to do serious mischief the *second* year after the breaking up of the sod," which would indicate that in severely infested fields it would be better to have some crop other than corn on the land for two years after sod.

In Massachusetts, Dr. Fernald reported good results by planting seed coated with gas-tar and then dusted in a bucket of fine dust and Parisgreen sufficient to give the corn a greenish color, this apparently repelling the insects and not affecting germination.1

The cultural methods here referred to are further discussed under the heads of Rotation (p. 6), Fertilization (p. 7), Fall Plowing (p. 7), Planting Increased Quantity of Seed (p. 7), Cultivation (p. 8), and Selection of Lands (p. 8).

WHITE GRUBS (Several Species).

Order Coleoptera. Family Scarabaida.

Description.—Thick-bodied whitish grubs reaching a length of 1½ inches; when disturbed, often curling up tightly; infesting sod lands or fields where much manure or decaying vegetation is present; living underground and doing damage by eating roots from corn, grasses, or other plants. When fully grown they change to brown "May-beetles," or green "June Bugs."

Injury in North Carolina.—As with other underground insects, injury by White Grubs is apt to pass unnoticed unless it becomes very serious, and also their presence in gardens and cultivated fields is taken so much as a matter of course that definite complaints of their injuries are infrequent in this State. But it cannot be otherwise than true that the total damage by them to our corn crop is considerable.

During inspection of wheat-fields in the spring, we have found these Grubs doing injury, though usually not to a serious extent.

White Grubs have been complained of to us as a pest in gardens, lawns, greenhouses, in grass fields, and in farm crops. But the most serious and definite complaint we have ever had came in August, 1913, from Mr. George F. Ogilvie, Oakwoods, Wilkes County. As this was evidently a typical White Grub outbreak, I quote from Mr. Ogilvie's letters, as showing the extent to which these pests may do damage:

"I have a few patches that I have been manuring up with stable manure. and at this time thousands of large White Grubs work under the manure. They throw up the dirt until one's feet sink in it. Where I have sown small seeds like spinach, they have completely ruined it. I have used on some plats a very large quantity of ashes, and yet the grubs are everywhere, even where you can see the ashes in the land."

(LATER) "Since I wrote you, they have been worse. I resowed my spinach plat, and they have again completely ruined it. I never saw anything like it; the whole surface of the ground is heaved and churned up until one sinks almost over the shoes."2

¹This statement from "Insects of Farm, Garden, and Orchard," by E. D. Sanderson, p. 83. I have not at hand the original report on the Massachusetts experiments.

²An interesting fact in this connection is that twelve years before this time, when I was in that vicinity on other work, Mr. Ogilvie was mentioned to me as a man who took special pains to manure his land heavily.—Author.

We have indicated that there are several different species of the White Grubs. As with the wire-worms and cut-worms, many of the species seem to do but little injury, while the greater part of Grub injury is probably due to only six to a dozen species. Of the groups of beetles to which they belong, however, we have evidence of not less than thirty-five to forty kinds in the State, with no doubt many more awaiting discovery.

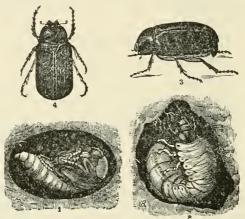

Fig. 2.—White Grubs. Showing adult beetles at 3 and 4. Larva eating roots of plants at 2, and pupa at 1.

(After Riley, Div. Ent., U. S. Dept. Agr.)

Life-history and Habits.—The most comprehensive work in this country on the life-histories and habits of White Grubs and their adult beetles has been done at the Illinois Experiment Station under Dr. S. A. Forbes.* But in the space of this Bulletin we can only give a general condensed account of the life-history.

The adult beetles appear in spring and early summer; they are the common brown "May-beetles" which often enter our houses at night, or the green "June-bugs," so familiar to children. The beetles mate and the females deposit their eggs preferably in grassy or weedy fields. The eggs hatch into the "White Grubs," small at first, but growing with age to from 1 to 1½ inches in length, feeding upon roots of many plants. The exact length of time required for the Grub to attain full growth is uncertain, but seems to be from two to three years. It then changes to a pupa, in a cell in the soil, and the pupa changes to a mature beetle, which, however, may not emerge to live an active beetle life until the following spring. In the writer's personal experience it is a common thing to unearth the adult beetles in gardens in fall, winter, or spring.

^{*}Among the several publications on this subject by Dr. Forbes I have been especially interested in Bul. 116, Ill. Exp. Station, "Life-history, Habits, etc., of White Grubs."

No doubt some species complete a generation quicker than others, or even in the same species the period may vary according to heat or cold, moisture or dryness.

Every careful observer knows something of the habits of the adult beetles. The green June-beetle usually appears at Raleigh around the first of July, and may be found abundantly feeding on ripe figs, grapes, peaches, and other fruits. The brown May-beetles are evening or night fliers, and often congregate on trees at dusk, where they eat the foliage.

REMEDIES.

Hogs, chickens, and some wild birds are fond of White Grubs, and to some extent can be made use of in combatting these pests. In garden plats or in small patches of corn much can be done by encouraging poultry to follow the plow or the spade, or by merely gathering the Grubs which are exposed and feeding them.

Cornfields which are known to be badly infested by them can surely be largely freed from them by turning in hogs after the crop is off, especially if by scarcity of feed or otherwise they are encouraged to root diligently. Dr. Forbes reports a case in which 100 pigs destroyed over 90 per cent of the Grubs in a badly infested 10-acre field in less than a month.

As the Grubs are more likely to be abundant and destructive in lands taken from sod, their injuries to corn can in some measure be prevented by putting lands fresh from sod in some other crops for the first year (or, better, two years) by which time the majority of the Grubs will have matured.

Sec, also, Rotation (p. 6), Fertilization (p. 7), Cultivation (p. 8).

CUT-WORMS (Several Species). Order Lepidoptera. Family Noctuidae.

Description.—Rather stout-bodied, soft, brown, blackish or grayish caterpillars, which remain concealed during the day and do great injury at night by eating off various kinds of young succulent plants at or near the surface of the ground.

Injury in North Carolina.—Everybody knows what Cut-worms are. So well known and so universally common and destructive are they that their injuries in ordinary seasons excite no particular interest or comment. Everybody takes it as a matter of course to lose a part of his cabbage, tomatoes, tobacco, corn, or any other green succulent crop, from their ravages. Like the potato-beetle and the house-fly, people take them so much as a matter of course that many persons give them no serious attention, and the complaints received of their injuries is in no sense a measure of their destructiveness. Most of the complaints that are made refer to their injuries in gardens, or flower-beds.

In 1901, specimens were sent from Moore County with the report that they were a scourge that year, and that the correspondent could not get a stand of melons until after the worms matured; he had found as many as ten or twelve around one dewberry vine. He also reported them as destroying beans, cabbage, leaves on young peach trees, etc.*

During 1905, reports of serious Cut-worm damage were frequent, indicating damage to many crops, including corn, cabbage, and tomatoes. Cut-worms are also recognized as a regular and serious pest to tobacco.

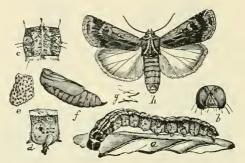

Fig. 3.—The Granulated Cut-worm (Feltia annexa), showing larva (a), pupa (f), adult moth (h), and details of structure.

(After Riley and Howard, Div. of Ent., U. S. Dept. Agr.)

Life-history and Habits.—As with the wire-worms, so with Cutworms: there are a number of different species concerned. They are all the caterpillar stage, or larvæ, of moths, and the family Noctuidæ to which they belong contains upward of two thousand species. The larvæ of all of these would not be considered as true Cut-worms, however, and of those which could be truly classed under that name there are probably not more than thirty or forty species that are ever serious pests in the eastern United States. From our scattered observations we believe that 95 per cent of all the Cut-worm injury in this State is caused by not more than six or eight species.

Much work yet remains to be done in rearing our southern Cut-worms to the adult state before it will be possible to give in detail the life-history of all of our common species. Some species mature and emerge as moths in early summer, while others emerge as moths in the fall. Thus far we have observed no species which is seen in the adult state both in summer and fall; so that it seems that they are all single-brooded, some of the species emerging as moths in early summer and other species emerging in the fall.

Mr. C. S. Brimley of Raleigh, who has long taken an interest in collecting, rearing, and studying insects, reared to maturity a number of

^{*}From letter from R. W. Caviness (deceased). Mr. Caviness was an excellent observer.

Cut-worms during 1903-'04. The notes here given refer to the dates on which the adult moths emerged in Mr. Brimley's cages, or when adult moths were captured:

The Granulated Cut-worm.—Feltia annexa, Treit, August 29, September 20, October 7, 12, 1903.

Feltia hirilis, Grote, September 17, 25, 1904.

The Dingy Cut-worm.—Feltia subgothica, Hawworth, September 12, 27, 1904. Prodenia commelina, Sm. and Abb., August 17, 1904.

Peridroma saucia, Hub., June 22, 23, 24, 1903.

Other species, not identified, emerged as follows: Species No. 1 (spring species), June 4, 28, 1903. One captured (not bred) May 30, 1902. Species No. 2 (fall species), October 7 (2 specimens), 12, 1903.

From these notes it seems that for the spring species June, and for the fall species September and October, are the principal months of activity and egg-laying by the adult moths.

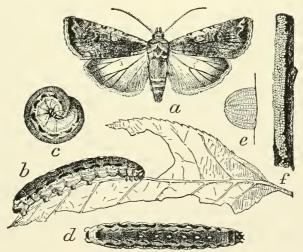

FIG. 4.—Another Cut-worm (*Peridromia saucia*) showing adult moth (a), larva (three views) (b, c and d), egg (enlarged) (e), and eggs in natural position on grass stalk (f).

(After Howard, U. S. Dept. Agr., Div. Entomology.)

Of course, the details in the life-history of a species will vary somewhat according as it matures in the spring or in the fall; but the following will serve as a condensed account:

The larvæ (the destructive Cut-worm stage) pass the winter in the earth, or on the surface under such shelter as they can find, in a partly grown condition. The long fast of winter gives them ravenous appetites when the warm days of spring arouse them to activity, and they feed on any green succulent young plants that they can find. Some species have the habit of climbing trees or other plants to eat the tender expand-

ing leaves, but those that are most destructive to corn do their damage by eating off the young stalks at or near the surface of the ground. Sometimes the severed stalk (if it be young and small) is dragged partially into the ground. The worms usually remain quiet during the day and feed mainly at night. Sometimes, however, they will work during the day if the weather be cloudy. Cool weather seems to sharpen their appetites. When the larvæ become grown (which varies according as the moth is to emerge in spring or fall), they change to pupe in the earth, an inch or so under the surface, sometimes only barely covered by the soil. Those that are to emerge in spring change to pupe about the middle or latter part of May; and it is because these larvæ become mature at this season that they cease their injuries, and not usually because of any epidemic of disease among them. In the pupa state they are without legs or wings, and take no food-it is simply a stage of transition from the larvæ to the adult moth. After a few weeks in the pupa stage the adult moth bursts from the pupa-shell. Most of the Cut-worm moths are dull gray or brown in general color, marked with lighter streaks or spots, and with the hind wings lighter in color, sometimes of a pinkish hue. When the wings are expanded they measure from one to two inches from tip to tip. These moths fly mostly at night and are often attracted to bright lights and not infrequently enter houses and flutter about the lamps or walls. The females deposit their eggs on trash, grass or weeds, in sod or weedy lands, and the larvæ become partly grown by winter and hibernate as already explained.

Summary.—Cut-worms are the larvæ of night-flying moths. They pass the winter as larvæ, eat voraciously in the spring, become mature, pupate, and emerge as moths in early summer or fall, according to the species. June, September and October seem to be the principal months for egg-laying. Eggs are deposited in weedy or sod fields, after which the moths die. The larvæ pass the winter in a partly grown condition in the fields. With these points clearly understood it will be easy to comprehend the following remedial suggestions:

REMEDIES.

As the eggs are laid principally in sod or weedy lands, corn planted on land just from sod or weeds is likely to suffer from Cut-worms. They are often numerous in clover sod also; yet corn after clover does so remarkably well that in general it pays to take the risk. If the corn must come after a growth of grass or weeds, then by plowing the land in fall or winter many of the Cut-worms will be killed or starved before spring. This result has been several times reported by farmers. In 1905, Mr. G. M. Bentley, at that time an assistant in this office, made some observations on Cut-worm injury to tobacco in Wake County. On a small plat which was plowed March 19th, he found seven plants destroyed, while on an adjoining plat of same size, with same number of

hills, plowed one month earlier (February 22d), he found only two plants destroyed. So far as this observation went, therefore, it showed that land plowed in winter was much less infested than land which was not plowed until spring.

By delaying the planting until moderately late in the spring, those Cut-worms which mature to moths in the spring will be nearly or entirely grown, and will therefore not do serious injury, and the extra time can be given to a more thorough preparation of the land. Frequent cultivation as soon as the corn is up will also disturb the Cut-worms in the soil and deter them in some degree.

But if we must put a piece of spring-plowed sod or weedy land into corn, and wish to plant at the normal season, there is still a method (not always easy or entirely satisfactory, perhaps) by which we may combat the Cut-worms. When the land is plowed in the spring much of their food is destroyed and they become hungry. It is then, after breaking and harrowing the land and before the corn is planted, that it is possible to poison them. Clover or other green and succulent vegetation may be poisoned with Paris-green and distributed through the fields as a bait to the worms. The clover may be sprayed as it stands and then cut; or perhaps the better and more thorough plan would be to cut it and dip it into a barrel of the poisoned solution. The Paris-green for this purpose should be thoroughly mixed with water at the rate of about one pound to the barrel (40 to 50 gallons) of water. Arsenate of lead may be used instead of Paris-green, at the rate of five or six pounds to the barrel. Paris-green and wheat bran have been used in gardens, at the rate of about one ounce of the poison to two or three pounds of the bran. A mash made of bran, Paris-green and water, and sweetened with molasses, has also been used by gardeners.

But in field operations with corn grown on a large scale, the main practices to be relied upon are:

- (1) Avoidance of corn after sod or weeds;
- (2) Fall or winter plowing, or very early in spring, if sod lands are to be put in corn;
 - (3) Moderately late planting.

For further discussion of the methods mentioned, see Rotation (p. 6), Fall Plowing (p. 7), Time of Planting (p. 7), Planting Increased Quantity of Seed (p. 7), Cultivation (p. 8).

THE CORN (AND COTTON) ROOT-LOUSE. (Aphis Madai-radicis, Forbes.)
Order Hemiptera. Family Aphidide.

(Also called "Blue-bug," "Blue-louse," "Blue Root-louse.")

Description.—A small greenish or bluish plant-louse attacking the roots of young corn, causing it to be of slow, belated growth or unhealthy color. Their presence often indicated by ants entering and leaving the ground at the hill.

Injury in North Carolina.—In this State this Root-louse has not often been reported on corn, though it does injury to this crop. It is much more often reported as a pest of cotton, and the writer believes that the first published record of it as a really serious cotton pest was in a Bulletin of this Department. Injury to corn, however, has been reported several times in recent years, from the counties of Bladen, Caldwell, Forsyth, Gaston, and Union. As it is a pest of cotton chiefly in our eastern counties, has been reported on corn to the edge of the mountains, and is known as a corn pest throughout the entire State of Illinois, we must conclude that it does attack corn throughout the entire length and breadth of North Carolina, even though definite complaints of it on this crop have been few. Like the other underground insects, it is likely to pass unnoticed except in the most aggravated cases.

Life-history.—Here again we must acknowledge our indebtedness to the work of Dr. Forbes in Illinois. Not only was he the original describer of the Corn Root-louse as a species, but what is known of its exact life-history comes largely from the work of his office. Working in a great State the chief crop of which is corn, he has studied carefully the insect enemies of that plant, and many of his publications have discussed this Corn Root-louse, and the relation which the attendant ant bears to it.

Dr. Forbes says that the first generation of Root-lice in the spring are all wingless, and if the plants on which they feed remain thrifty, many generations in succession will be wingless; but that if the plant becomes overcrowded by them and seems likely to die, then many of the oncoming generations have wings which enable them to migrate in search of new plants. Such stray lice are found by the ants which attend them, and are quickly placed on roots of plants which will support them—on corn if in a cornfield. Here they multiply until the approach of winter. All this time, from the opening of spring through many generations, only female Root-lice are produced, all being born alive (no eggs); but as cold weather approaches in fall, the last generation contains both males and females; these mate, and the fertilized females lay eggs which pass the winter and hatch to wingless females in the spring. In Illinois Dr. Forbes finds an average of about sixteen generations per year.² The louse is largely dependent upon the cornfield ant, for this ant stores the eggs of the Root-louse in its burrows over winter, and when they hatch in spring they place the young lice on the roots of plants upon which they can feed. The lice secrete from their bodies a sweetish substance known as "honey-dew," and it is to obtain this that the ants attend the lice. The ants themselves do not hurt the corn (or cotton), nor do they give birth to lice, nor do they de-

¹Vol. 29, No. 6. Bul. N. C. Dept. Agr., June, 1908, "Insect Enemies of Cotton," by F. Sherman, p. 17.

²Account condensed from "The Corn Root-aphis in Illinois." Circular of Ill. Exp. Sta., Jan., 1913, by S. A. Forbes.

stroy the lice. They are an entirely distinct species of insect and attend the lice for the purpose of securing the honey-dew.

Although with us this Root-louse is recognized as a pest only on cotton and corn, it is known to feed on the roots of many other plants which may tide it over in places or in seasons when corn or cotton are not within its reach.

REMEDIES.

Throughout our cotton-growing region the time-worn two-year rotation of corn one year, cotton the next, and then back to corn again, acts directly in favor of the increase of this louse, for it feeds upon the roots of both these plants. Hence a rotation which shall at least every third year put some crop on the land other than cotton or corn would surely offer a hope of relief.

Corn (or cotton) fields which have been infested may be deeply winter-plowed to break up the ants' nests, the soil being deeply cultivated (or disked) before being planted to the next crop.

It stands to reason that thorough preparation of the land, liberal fertilization, and frequent cultivation will all tend either to discourage or interfere with the ants or the lice, and will encourage the crop to healthy growth which may withstand moderate attacks.

THE CORN BUD-WORM. (Diabrotica 12-punctata, Oliv.)
Order Colcoptera. Family Chrysomelidw.
(Also called "Root-worm" and "Drill-worm.")

Description.—A slender worm or grub, half an inch long, yellowish white, destroys young corn by eating into the stalk below ground, killing the central portion. Worse on lowgrounds in cool belated seasons. The adult beetle is about one-third inch long, yellowish green with twelve black spots, feeding on many plants and often destructive on squash and related crops.

Injury in North Carolina.—The Corn Bud-worm is a pest of long standing in this State, so much so that a certain amount of injury by it is taken largely as a matter of course. From the very considerable number of letters which have come to us regarding it, we quote from several to show the nature of the injury as the farmer sees it:

"Have been troubled with something that kills my corn from time it comes up until 6 or 8 inches high; looks like a worm had cut the heart of the corn under the ground near the root; the heart dies and the stalk is worthless."

"Corn Bud-worms are the worst insect I have to contend with. On low bottom-lands they kill about one-half of it in cool spells. They work about an inch from the grain of corn."

"A great deal of my corn is killed by Bud-worms when about a hand high."

In June, 1907, I was told that it was unusually destructive that year in Henderson County, and that it is regularly worse in wet, cool seasons.

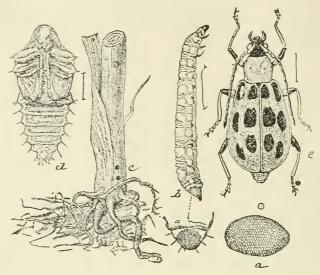

Fig. 5.—The Corn Bud-worm, showing adult beetle (e), larva (b), pupa (d), and egg (a), all enlarged; natural sizes indicated by lines, etc., at side. Work on corn shown natural size at c. (Redrawn from Riley, Div. Ent., U. S. Dept. Agr.)

Field Notes on the Adults.—Our own notes throw some light on the habits and behavior of the adult beetles.

Hibernation.—The winter is passed in the adult stage, presumably under any adequate shelter. In December, 1906, I found many sluggish adults inside of cracked gourds in a field in Brunswick County, and this may be a common place for hibernation. On October 31, 1900, at Raleigh, I found many eating into and inside of gourds which were green, but the vines of which were dead. But I believe that many (perhaps most) of them pass the winter under rubbish or trash.

Emergence in Spring.—March 10, 1904, I found adults common in blooming strawberry fields in Pender County. By March 25, same year, had noted them feeding on opening leaf-buds and flowers of fruit trees at both Southern Pines and Raleigh. In 1907 I noticed first adults in flight at Raleigh on March 22. In 1908, on March 25, adults were plentiful at Raleigh feeding on many kinds of new vegetation. In 1909, April 16, at Louisburg, Franklin County, I found them abundant on young pear foliage, many females heavy with eggs; though an assistant noted adults mating freely as late as May 17 in 1907, at Raleigh. In 1913 I saw the first active adult in garden at Raleigh on March 29.

Later Habits of Adults.—In October, 1900, I noted that adults were common on goldenrod and aster. On May 17, 1907, Mr. R. S. Wog-

lum, assistant, noted them abundant on squash at Raleigh, as many as 25 on one leaf, and mating was common. At Andrews, Cherokee County, on May 20, 1911, I found adults plentiful on cabbage in garden, and indicated their presence on beans. As a matter of fact, the adults feed freely on leaves and flowers of many plants, and are not confined to any particular kinds.

Life-history.—Prof. F. M. Webster' has recently published an account of this pest, in which he has brought together the observations of many workers, and concludes that "from all available information it appears that the egg period varies greatly and may require from 7 to 24 days, the larval (worm) period 15 to 35 days, and that of the pupa (between the worm and the adult beetle) from 7 to 13 days."

Dr. Chittenden² records one individual adult beetle as having laid 209 eggs, though this is probably above the average, and he concludes that there are three broods at Washington, and possibly four further south.

Briefly stated, the general life-history of the insect seems to be about as follows: The adults pass the winter, emerge very early in spring, feeding on flowers and foliage, mate, and lay eggs at the base of corn or other plants in which the worms feed; the worms on hatching from the eggs, burrow into the root or stalk of the plant attacked, become grown in a few weeks, leave the plant and change to the pupa state in the earth close by, from which the beetles emerge one to two weeks later. Several broods are produced in the course of the season.

Two farmers in North Carolina, Dr. Porter of Pender County and Mr. James Middleton of Wake, placed jars over infested corn plants and thus bred the adult beetles.

REMEDIES.

The time of planting appears to be the greatest factor in preventing Corn Bud-worm. The complaints quoted show it to be worse early in the season, or in cool spells of early spring; hence the general later planting of corn would suggest itself.

In South Carolina Mr. W. A. Thomas³ divides his State into three general regions corresponding to our (1) coastal plain, (2) lower piedmont, and (3) upper piedmont, and concludes (in *South Carolina*, be it remembered) that in the first or eastern of these divisions corn planted after May 5th will escape the worst of the injury; in the second or middle region, after May 12th, while in the west, after May 19th. For our own State, we should be inclined to make all the dates from one to two weeks later to allow for difference in latitude and elevation.

But the experience and testimony of farmers themselves cannot be wholly disregarded, at least not unless the most exact and definite evi-

¹Bul. No. 5, U. S. Dept. Agr., Sept. 27, 1913, "Southern Corn Root-worm or Bud-worm." F. M. Webster.

²Cir. 59, Bur. Ent., U. S. Dept. Agr., "Corn Root-worms." F. H. Chittenden, March, 1905.

³Bul. 161, S. C. Exp. Sta., "The Bud-worm of Corn." W. A. Thomas, March, 1912.

dence to the contrary can be produced; and in North Carolina many farmers insist that they can escape the bulk of Bud-worm injury to their corn by either very early, or late, planting. An intelligent farmer in Yadkin County at the Farmers' Institute in August, 1908, said that with him corn planted in either April or June was not much hurt by Bud-worms, but if planted in May, it was hurt. His testimony is typical of that offered by many others, though somewhat more explicit.

If one's experience shows that either early or late planting will escape bud-worm injury, then we would incline to give the late planting the preference, as it will have the tendency to avoid other pests (cut-worms, stalk-borers), and also allows opportunity for better preliminary preparation of the ground.

It has been noted that Bud-worm is worse on lowlands, hence the use of other lands for corn when entirely available and convenient, will help

to avoid injury.

As with many other corn pests, ample cultivation and liberal fertilization will enable the corn to recover from slight attacks. Also the planting of liberal amount of seed will provide enough plants for a "stand," even though some is killed by Bud-worm.

THE CORN BILL-BEETLE.

Order Coleoptera. Family Calandridæ. (Also called "Bill-bug," "Klew-bug," "Curlew-bug," etc.)

Description.—A grayish to blackish hard-shell beetle about ½ inch long, with strong down-curved beak or snout; damages corn by puncturing the stalks near the ground.

This is one of the worst corn pests in the eastern part of the State. Many points in regard to its life-history, habits, and methods of control are not yet entirely clear; and as it is now under special investigation by Prof. Z. P. Metcalf of our Experiment Station, it is considered best to omit any effort at detailed discussion.

THE CORN-ROOT WEB-WORM. (Crambus caliginocellus, Clem.)
Order Lepidoptera. Family Pyralidæ.

Description.—Whitish caterpillars with small black spots on body, attaining length of ½ to ¾ inch; attacking young corn near the ground; each caterpillar surrounding itself with a slight web.

Injury in North Carolina.—Only a few complaints have come to us regarding this insect, and we shall devote but little space to it. Yet we feel sure that in the total it must do considerable injury, for the adult moths are very common in grassy fields at Raleigh in summer and the insect is of wide distribution.

[&]quot;The idea of early planting to escape bud-worm also exists in Alabama. Cir. No. 8, Ala. Exp. Sta., March, 1911, "Bud-worms in Corn," by W. F. Turner, p. 6.

Life-history and Habits.—The adult insect is a delicate little moth of silvery-gray color, which frequents grassy fields, where the eggs are laid in summer and fall. The larvæ normally live upon grasses, eating into the stems or bulbous roots at the surface of the ground. When corn is planted on land just from sod the larvæ are often already present in great numbers, and being deprived of their natural food of grasses, they attack the corn, eating into the stalk at the surface of the ground, each larva being somewhat protected by a loose web which acts as a barrier to predaceous enemies and parasites. When grown the larva is about three-quarters of an inch in length, yellowish-white, pinkish, reddish, or even of a reddish-brown color, being quite variable. In midsummer they change to the pupa state at or close to the base of the plant, and emerge as moths two weeks later. Eggs are at once laid in grass lands, where the partly grown larvæ pass the winter and are ready to commence feeding as soon as spring opens.

REMEDIES.

By avoiding corn immediately after sod much of the injury by this insect will be averted. If sod land is to be planted in corn, fall plowing will kill many of these insects by exposure or starvation.

THE LARGER CORN STALK-BORER. (Diatrwa saccharalis, Fab.)
Order Lepidoptera. Family Pyralidæ.
(Sometimes called "Shatter-worm.")

Description.—Whitish caterpillars with brown or black specks, reaching length of about 1 inch, injuring corn by boring into the stalk and (when corn is young) into the terminal growing part, causing weakness and distorted growth, rendering the plant worthless when the attack is severe. Injury becomes evident in June. The adult moth measures about an inch from tip to tip of wings, is yellowish-brown, and is an active flier.

Injury in North Carolina.—This is a prevalent pest in this State and at times very destructive. While most of the complaints have come from the southern and southeastern counties, we believe it to be present throughout the State, at least east of the mountains. We have reports of it from the following widely separated counties, as well as many others: Alamance, Columbus, Duplin, Edgecombe, Mecklenburg, Rutherford, and Warren. It is considered to be rather a southern insect, and is a standard pest of sugar-cane in Louisiana.

At Red Springs, Robeson County, in 1902, the writer found it abundant and destructive, as many as six of the worms being taken from a single stalk, and from 10 to 15 per cent of the stalks were ruined. At Raleigh, in July, 1913, I found much injury by it in a garden, the worms even working in the tops which were bunched for tassel; in the stalks

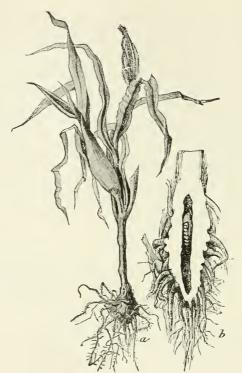

Fig. 6.—Work of the larger Corn Stalk-borer. a, appearance of young stalk badly injured. b, stalk cut open near root to show burrow and pupa inside. (After Howard, Div. of Ent., U. S. Dept. Agr.)

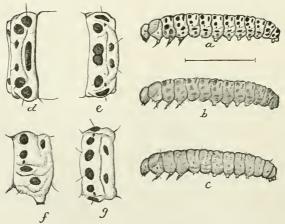

Fig. 7.—Showing larva of larger Corn Stalk-borer, a, b and c showing variations in the markings, etc. Natural length indicated by line below a. d, e, f and g, views of certain parts of body of larva.

(After Howard, Div. of Ent., U. S. Dept. Agr.)

they were present above where the ear would be. As a rule, it works in the lower part of the stalk (especially later in the season) and often close to the ground. In Mecklenburg County it was reported as having destroyed a very serious per cent of the stalks in 1913.

Life-history.—As an enemy of corn, studies of this pest have been published by both Dr. L. O. Howard¹ and George C. Ainslie² of Washington, and by Prof. R. I. Smith,³ formerly of the North Carolina Station. Two distinct broods are recognized. The winter is passed in the caterpillar stage below the ground level in the stalks or roots of corn, perhaps also in some other plants. In spring the caterpillars change to the pupa state, from which the adult moths emerge after about two weeks. These moths then lay eggs on the young corn and these hatch into the first destructive worms of the season, boring into the stalks and tops of the growing corn, their injuries becoming noticeable from June 10 to 20, at which time the worms are growing rapidly and

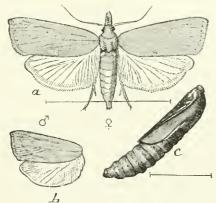

Fig. 8.—Pupa and adult of larger Corn Stalkborer. a, adult moth. b, showing wings of male moth. c, pupa. Natural size of moth and pupa indicated by lines.

(After Howard, Div. of Ent., U. S. Dept. Agr.)

boring actively in the stalks. In Robeson County (1902) we found grown worms and others that had changed to pupe on June 30th, and from these we reared adult moths July 8th. The first brood of moths, therefore, appeared that year to emerge first half of July, though two years later we received larvæ from Mecklenburg County on July 2d; so in the higher and cooler sections they are probably always somewhat later in reaching maturity. The second brood of worms burrow into the stalks chiefly in the first two joints above ground, and often so weaken them that they are blown to the ground. The worms of this second generation become grown by harvest, burrow down the center of the stalks

¹Cir. 16, second series, Div. Ent., U. S. Dept. Agr., "Larger Corn Stalk-borer." L. O. Howard, Aug., 1896, "Cir. 116, second series, Bur. Ent., U. S. Dept. Agr., "Larger Corn Stalk-borer." George

N. Ainslie, Feb., 1910. "Bul. 197, N. C. Exp. Sta., "Insects of Garden Crops." R. I. Smith, May, 1908, p. 35.

to the root, and there pass the winter in the full-grown condition, changing to pupe in the spring, from which the moths emerge to lay eggs for the destructive spring brood of worms.

It must be remembered that no exact dates can be set for the times at which moths will emerge, or eggs be laid, for these will vary with the season and elevation. Thus at Raleigh, in 1913, we found larve abundant in cornstalks July 1st, and in 1905 we found pupe July 15th in stalks from Johnston County, though in 1902 we bred adult moths July 8th. But it seems fairly well established that normally there are two full broods each season. It is quite likely that some of the worms of the second brood feed on other plants than corn—indeed, in addition to corn and cane, Ainslie says that it has been reported on sorghum, Johnson grass, guinea-corn, and gama grass.

If each worm simply burrowed once into the stalks and remained inside, the case might not be so serious; but they have the destructive habit of leaving and reëntering the stalk again, so that each worm may make several holes.

REMEDIES.

Thorough destruction of stalks which have been rendered useless, remnants, and stubble, would seem to be the most likely method of control. If infested stalks be cut close to the ground while borers are still in them, and fed green, many of the borers will inevitably be destroyed. If the stalks are left standing until the usual time of harvest, and are then cut close to the ground and shredded or made into ensilage, it is to be presumed that some of the second brood will be destroyed. Those left in the stubble can then be reached by plowing out the stubble, raking together and burning. Through the early part of the season (up to about July 1st) stalks which have already been rendered worthless should be pulled and fed green as fast as they are seen to destroy the worms in them, for they have no future value anyway. Our common eustom of "pulling" the fodder and allowing the stalks to stand is favorable to this insect. But if the fodder is to be "pulled," and it is desired to allow the stalks to rot in the field, then if they be plowed under as deeply as possible the adult moths would have difficulty in emerging.

Next to the destroying of the Borers themselves in the stalks, the later average planting seems to offer the best hope of escape. The data already given indicate that corn planted reasonably late will largely escape injury by the first brood, though it will be exposed to the second brood. Dr. Howard presents results noted in 1891 (in Virginia?), from which the following is given:

Date of Planting.	Per Cent of Damaged Stalks.
April 1 to 15	
April 15 to 28	
May 1 to 15	
May 15 to 31	12
June 1 to 15	

Mr. Ainslie also recommends rotation as one of the best preventive measures, and says: "Where corn has followed itself on the same field for two or more years there has been a much greater loss than where a change of crop is practiced, especially where stalks and stubble remain undisturbed through winter." But he also says: "By far the most effective plan is to remove the stubble from the field with a rake and burn it."

The writer believes that this Stalk-borer offers a good chance for cooperative effort, for the moths are active fliers and can readily make their way from one field to another; hence it would seem that best results would be secured by all the farmers in a locality using the same methods at the same time.

THE CHINCH BUG. (Blissus leucopterus, Say.) Order Hemiptera. Family Lygwidw.

Description.—Small bugs about one-fifth inch long, blackish with white wings, the young bugs reddish. Appear at times in great numbers in wheat, oats, corn, millet, and timothy. There are both long-winged and short-winged forms. Most destructive in our piedmont section on "poor land." Primarily a dry-weather pest.

Injury in North Carolina.—This insect is very irregular in its appearance as a pest. It is present every year, but only at irregular intervals does it become excessively abundant. Any pest of this character is sure to be often reported when it does appear in numbers, especially by those of the younger generation of farmers who have not become indifferent to its ravages. Farmers who have lived long in the region of Chinch-bug injury well know of their destructiveness; others may take our statement for it that when conditions favor their increase they appear by millions, sucking the sap from the plants until they dry up as if from drought or fire. At such times the destruction is often complete, every stalk being sucked to death (not eaten) by the insects. From our somewhat voluminous correspondence we quote the following as typical and enlightening:

"They came from my wheat-field and are sucking my corn to death; have eovered 2 or 3 acres in ten days." (Later) "They are not doing very much while the heavy rains fall."

"I think they first appeared in oats, then destroyed sorghum-cane, now in the corn and are destroying it. They get around the stalk near the ground and on the blades and suck it to death; seem to move in a solid army. Parisgreen will not kill them."

"After harvest the bugs came from the adjoining wheat-field, marched into my corn and sucked it until it died or was so dwarfed (next the wheat) that no ears could form."

"Since the wheat was cut they have gone into the corn. They cover the stalk around the roots and in a few days the stalks will die."

"They gather at the root of the corn (or) under the sheath of the blade and there suck until they ruin the whole stalk."

"They sometimes ruin our corn on the clay land. If I had a remedy would prefer to plant corn on the clay and cotton on the sandy land."

In May, 1905, a correspondent in Rockingham County wrote that he had suffered destruction to timothy by Chinch Bugs for four years in succession; but we are forced to believe that this was a very unusual experience, at least for this State.

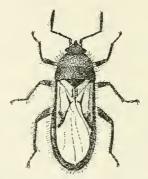

Fig. 9.—Adult Chinch Bug, showing dark color of body and white wings. Much enlarged. Insect in reality about one-fifth inch in length. This is the long-winged form of the insect.

(After Webster, Div. Ent., U. S. Dept. Agr.)

DISTRIBUTION, HABITS, LIFE-HISTORY.1

Distribution.—The Chinch Bug occurs throughout the United States east of New Mexico, Wyoming, and North Dakota (including parts of those States); also in southern and eastern Canada, eastern Mexico, in Central America and Panama; also in areas in California. It seemingly is absent in southern Florida, and occurs sparingly if at all in the higher Alleghany Mountains (statement made from Webster's Map). The area in which it is to be regarded as a pest is more restricted, embracing a large territory in what we term the "central west" (including Kansas, Iowa, Missouri, Illinois, etc.). There are spots of severe infection in Maine, New York, Tennessee, and Louisiana. But what is of

¹Among the writings on Chiuch Bug, we may mention Bul. 95, Ill. Exp. Sta., by S. A. Forbes; "The 1912 Chinch Bug Campaign in Illinois," by S. A. Forbes; Bul. 69, Bur. Ent., U. S. Dept. Agr., by F. M. Webster; Cir. 113, Bur. Ent., U. S. Dept. Agr., by F. M. Webster; Bul. 191, Kan. Exp. Sta., by T. J. Headlee and J. W. McCulloch.

most concern to North Carolina farmers is the fact that a belt of badly infested territory begins in central Virginia, extends entirely across the piedmont area of North Carolina, and terminates in South Carolina. (Webster's Map).

This indication by Professor Webster is in accord with the ravages reported in North Carolina. The only strictly eastern counties from which we have had complaints are Pamlico and Gates; but in the piedment section complaints have been numerous from Warren to Stokes counties on the north, southward to and including the counties of Wake, Lee, and Anson in the east, and Rowan, Iredell, and Gaston on the west, thus including the greater part of our "piedment" area. The writer has, however, collected specimens of the bug at Beaufort on the coast; but it has not been reported as a pest there.

(After Riley, Div. Ent., U. S. Dept. Agr.)

Habits and Life-history.—Adult bugs pass the winter in grasses, under rubbish, etc. At Raleigh we have found them in winter under boards at grassy edges of fields. When spring opens these bugs take flight early and seek growing grasses or small grains which will serve as food. In 1905 (while inspecting wheat-fields for Hessian Fly with Professor Webster), it was found April 11 in Guilford County at base of wheat plants. We did not find eggs nor observe mating. On April 14 (1905) Professor Webster found one adult in wheat-field in Mecklenburg County. My notes of that trip say: "Farmers say they appear worse in spots near stumps, stones, and trash, in which, no doubt, they hibernate. Stones and trash were near where these were found." The adults which emerge in spring fly freely in search of suitable food.

Once settled in the fields of small grain (or grass), they finally lay eggs, and the young bugs which hatch feed on the growing plants. The young bug bears a general resemblance to the adult, though it is reddish and wingless (there is no worm, larva, or caterpillar stage in the

Chinch Bug). About the time of harvesting wheat and oats these young bugs mature, and they then spread to cornfields for new food, doing so mostly by walking or crawling instead of flying, though they have wings. Another brood of young then develop in the corn, and these, when winter approaches, seek winter quarters. There are, so far as positively known, only two complete and distinct broods, the first maturing in the small grain and the second in the corn. This fact of two distinct broods and the habit of migrating is clearly indicated in the letters of complaint which we have already quoted. But it is worthy of special emphasis that in going from the wheat or oats to the corn, they do so chiefly by crawling (not flying), for on this point the protection of the corn from the bugs largely depends.

The Chinch Bug, both in young and adult, is provided with a beak attached to the head, which is thrust into the plant and through which the juices are sucked. Being thus a sap feeder, it cannot be poisoned by Paris-green, etc., which must remain only on the surface of the plant. The effect of their attack is to dry out and wilt down the plant.

There are two forms, or races, of the Chinch Bug: one having wings nearly as long as the body when adult, the other having decidedly shorter wings when adult. It is said that the short-winged form is more prone to attack grasses; while it is the long-winged form that is the chief enemy to corn.¹ All the adult bugs in our collection are of the long-winged form.

Dry Weather Favors Chinch Bugs.—Usually Chinch Bugs are more destructive in dry weather, and in wet seasons they are not so noticeable. This is apparently because of certain epidemics of disease among them which are more virulent during wet seasons. It is well for farmers to know this, as it is often convenient to be able to forecast, even though imperfectly, their probable appearance in any locality in destructive numbers. Heavy showers also drown many of them.

Worse on Certain Lands.—A preference for clay lands rather than sandy is indicated in the complaints already quoted, and the same or similar testimony is often offered to the writer when discussing this insect at Farmers' Institutes. We have also been assured at Institutes (humorously but seriously) that there is no better preventive for them than stable manure, as they are sure to be most destructive on the "thin, poor spots in the field," and that the farmer on thin, poor land suffers worse from them than the one on rich, strong land. In any event, we can all agree that the more vigorous and healthy the corn, the more resistant it will be to slight injuries, whether from this or any other insect.

Natural Enemies.—On account of a very disagreeable odor possessed by these insects, one would not expect to find many enemies which

¹Cases similar to this are known in other insects. Certain grasshoppers which inhabit densely grassy places are short-winged and cannot fly, while closely related species occurring in the open have longer wings and can fly.

would devour them. Although a large number of birds doubtless eat them to a greater or less extent, the quail or common "Bobwhite" stands at the head of the list, and the blackbirds, bobolinks and sparrows follow.

But by far the most prevalent natural enemies of the Chinch Bug are certain diseases, particularly those of a fungous nature, which not infrequently save many thousands of dollars to the farmers by destroying the bugs. One of these fungous diseases, known as the Muscardine fungus, has been considerably experimented with in Kansas and some other states, to see if it could not be artificially introduced into fields where the bugs were doing injury; but it is so slow to get started, and so uncertain in its results, that it has never come into general use.

REMEDIES.

Out of all the mass of recommendations for the control of chinch bugs, three methods stand out as available and useful as conditions exist in this State: (1) Destruction of the bugs in their winter quarters; (2) preventing them from spreading from wheat or oats to corn by means of barriers to their progress, and (3) killing them (the young ones, at least) by spraying while they are in restricted areas, before they have spread throughout the cornfield.

Destruction of Bugs in Winter.—In Kansas, where the bugs seem to hibernate largely in bunch-grass, they have been successfully destroyed by burning over closely so as to reach those that are close down between the bases of the stems. In North Carolina we at present know of no one place in which the bugs especially congregate for winter, but have found them under rubbish in grassy places near cornfields. Hence the cleaning and burning over of such waste places, fence-rows, ditch-banks, etc., adjacent to cornfields which were infested in summer will seem likely to destroy many of the over-wintering bugs. But as the bugs are not usually serious with us two years in succession, farmers may neglect this after-measure, and may be more inclined to depend on the next method discussed, namely:

Preventing the Spread into Corn, by Barriers.—For this purpose, a deep furrow, a strip of plowed and finely pulverized soil, a narrow strip of tar laid in a furrow or even simply on the ground—these all serve to check the insects in their march from one field to another. If a furrow is to be used it should be deep and so run that the earth shall be thrown toward where the bugs are already congregated, so that they will have to climb the steep side of the furrow. If the insects are found in the oat stubble, for example, one or two such furrows should at once be plowed around the field to prevent their escape. Two furrows a few feet apart will of course be more effective than one.

The furrow may be made still more effective by digging holes with regular post-hole digger every 15 to 20 feet in the bottom of the furrow. The bugs falling in the furrow will run along trying to find an outlet, and presently falling in the holes, will be quite unable to escape.

Infested stubble can be burned over, if thick and dry enough, or

plowed deeply and rolled or dragged to finely pulverize the surface.

If a strip several yards wide be plowed around the infested oats or wheat and this be finely pulverized, the bugs will have difficulty in crossing it so long as the surface remains dry and dusty; rain will hinder its usefulness.

The use of a strip or line of tar around a field serves the same general purpose.² Two such strips a yard or two apart will be even more effective. The earth may be scraped clean along the line where the tar is to be placed, so that sticks, grass or weeds shall not serve as bridges for the insects to cross.

Where a part of the cornfield has become infested, the same methods may be employed, separating the infested from the uninfested parts of the field, so as to check their advance.

Of course, the best protection will be secured by the employment of

several of these methods together.

The success of these methods is based upon the fact that the adults which mature in June crawl rather than fly, even though they do have wings. And as their legs are short and their bodies comparatively inelastic, they find it difficult to overcome obstacles such as have been mentioned; furrows, strips of tar, or finely pulverized soil making very effectual barriers to their progress. Of course, a sudden dash of rain may destroy the barriers, which must be replaced at once.

Spraying.—We are not advocating the spraying of whole cornfields to protect them from Chinch Bug. This spraying method is available

chiefly while the bugs are only in restricted areas of the corn.

Kerosene emulsion has been recommended for this purpose by Professor Webster (1907), to be prepared as follows: Dissolve ½ lb. of hard soap in 1 gal. water, bring to a boil, then pour in 2 gals. kerosene and churn together vigorously until it becomes cream-like. To each gallon of this add 15 gallons of water, mixing thoroughly. He states that it is best to spray the corn with this before 8 a. m. or after 5 p. m., as it will then be less likely to hurt the plants.

But in the writer's personal experience with plant-lice he finds that ordinary grades of laundry soap dissolved in warm water is an excellent substitute for the more complicated (and more dangerous to plants) oil

¹Headlee and McColloch, in Kansas, found a blast-torch preferable for destroying the burs along the barrier.

²In Illinois, Dr. Forbes had excellent results from "Road Oil No. 7," a grade costing about \$3.50 per barrel and especially prepared for Chinch Bug work. (Standard Oil Refinery, Whiting, Ind.) In this State tar would perhaps be more available.

emulsion. And Dr. Forbes in his Chinch Bug work in 1912 found that, "Chinch Bugs were killed by the soap solution alone, with no injury to the corn, if cheap rosin soaps were used at the rate of 1 lb. to 6 gals. water."

In this State such brands as "Octagon," "New Home," and the like are everywhere in common household use, and we have controlled many plant-lice by using these brands dissolved in water at rate of 1 lb. to 4 gals. Hence we give the method by which we have prepared it, believing (without actual test against this particular pest) that it will be quite satisfactory against young Chinch Bugs:

Cut 1 lb. of soap into thin slices in 2 gals. water. Bring to boil to dissolve the soap; now pour in 2 gals. water (cold preferably), and spray while the solution is still warm.

If the cheaper grades of "rosin soap" are on hand, they may be used in same way, or, as suggested by Dr. Forbes, even at the weaker strength of 1 lb. to 6 gals. In spraying for Chinch Bugs use liberally enough to thoroughly *drench* them.

In closing this discussion of the remedial measures for the Chinch Bug, it is of interest to read the following letter from one who used the furrow method. This letter is here given because there are so many who believe that such a remedy will not prove satisfactory:

* * Will say that I first had deep furrows, throwing the dirt from the corn and then bedded back to the corn. In this way the bugs were held in check, and destroyed only ten or twelve rows that they first appeared in. Thanking you for your prompt reply, I am.

Very truly, W. N. Boyd.

Warrenton, Warren County, N. C., October 19, 1904.

ARMY WORMS-TWO KINDS.

Order Lepidoptera. Family Noctuida.

There are two distinct, though closely related, species of corn insects which when abundant are commonly called "Army-worms." The adults of both are moths and they belong to the same family (Noctuidæ), which family also contains the cut-worm and car-worm moths, discussed in this Bulletin.

As the life-histories of these two insects differ, we discuss each separately. The one which normally is destructive earlier in the season is the true "Army-worm"; the other which is destructive later is distinguished by the name of the "Fall Army-worm."

THE ARMY-WORM. (Heliophila unipuncta, Haw.)

Description.—The grown caterpillars are about 1½ inches long, of a dark gray or blackish color with three narrow yellowish stripes above

and a darker and broader one on each side, appearing at times in hordes of countless thousands, devouring vegetation of various kinds, but especially grains and grasses. The adult moths spread about 1½ inches from tip to tip of the wings and are brownish-yellow in color.

Injury in North Carolina.—Very few outbreaks of this insect have been reported to us, although it is certainly present in at least limited numbers every year. Adult moths are often found at Raleigh from May to November. We have one adult moth captured by the writer at Hendersonville in June, 1907. The indications are that it occurs throughout the State, but that its area of destructiveness is chiefly in the western half.

In 1907, three complaints of damage by it were received from the mountains, but in no case was the outbreak reported as widespread. The complaints were all in May.

In August, 1908, while the writer was in the western part of the State on Institute work, news of an "Armyworm" outbreak came from Durham, N. C., and this was looked into by Assistant Z. P. Metcalf, some of whose observations will be presented later in this account.

Life-history, Habits, etc.—There are undoubtedly several broods of this insect each year, for at Raleigh the moths have been collected from May to November by Mr.

Fig. 12.—Army-worm moth, pupa and eggs on grass stem. Natural size. (After Comstock, Div. Ent., U. S. Dept. Agr.)

Fig. 11.—Armyworm (larva) on head of timothy. Natural size. (After Comstock, Div. Ent., U. S. Dept. Agr.)

C. S. Brimley. Dr. Forbes¹ states that only one brood is apt to be destructive in any one locality in any one year. This agrees with the reports which have come to us; and observations in 1908 indicate that there is a good reason. It is believed that the winter is spent in the

¹An excellent account which I have consulted in this connection is given by Dr. S. A. Forbes in Bul. 95, 1ll. Exp. Sta. Some of the statements are also based on a Bulletin of the N. Y. (Cornell) Exp. Sta., by M. V. Slingerland.

adult moth state, the moths laying eggs in early spring in grassy places, each female moth being capable of laying several hundred eggs. The worms which hatch from these feed on grasses, and when the supply is exhausted may march in an "army" into corn or other grain. They feed eagerly, grow rapidly, and finally enter the earth to change to the pupa stage, from which adult moths emerge in two weeks, and these, after mating, lay eggs for another brood.

When searching for new food they often move in a solid army containing countless thousands of individual worms, and devour all suitable food as they go. The records that we have for this State indicate that they have destroyed corn, grasses, and timothy; but wheat, oats, millet, etc., are also relished. Their preference seems to be for the grasslike plants; but in absence of these, they may be induced by hunger to take others.

Natural Enemies.—Fortunately, this Army-worm seems especially susceptible to subjection by its natural enemies, among which the most important seems to be a parasitic fly (Winthemia 4-pustulata, Fab. Order Diptera). This fly is somewhat larger than a house-fly and more bristly. It lays its eggs on the skin of the Army-worm and the fly-maggots hatching from these eggs eat into the body of the worm, usually causing its death before it can reach the adult moth stage to perpetuate another brood.

Mr. Z. P. Metcalf, at that time assistant in this office, made observations on the activity and efficiency of these parasites during the Armyworm outbreak at Durham in August, 1908. Out of 491 worms which Mr. Metcalf brought back and confined in cages, 442 were infested with eggs of this parasite, leaving 49 without parasites,—yet 61 of the worms developed to the pupa, but only 7 yielded adult moths. In a few cases he found that where only a single egg had been fastened to the worm, that it was able to complete its changes and emerge as an adult moth. But the fact of only 7 moths developing from 491 worms indicates that over 98 per cent of the worms died before reaching maturity, while from these same 491 worms he reared 556 adults of the fly-parasite. His data showed that while many of the parasites also died before they matured, that the rate of mortality with the Army-worm was over 98 per cent. while for the parasite it was 73 per cent. This difference would undoubtedly be much greater could the rate have been calculated from egg to adult in both cases; but this was impossible. But these results show that the tendency would be for the flies to rapidly overtake the worms in number, and subdue them; and this, no doubt, in large measure explains why the Army-worm is not more often destructive, and why it is that usually only one destructive brood shows up in a locality in any one season.

REMEDIES.

The remedies for this Army-worm are much the same as for the Fall Army-worm next discussed, hence will be considered in that connection. (See page 40.)

THE FALL ARMY-WORM. (Laphygma frugiperda, S. & A.)

Description.—Grown caterpillars are from 1 inch to 1½ inches long; along each side a black stripe and in middle a wider yellow-gray stripe which includes four black dots on each body segment. Sometimes occurring in great numbers together, in late summer, though often more scattering; feed on great variety of plants. The adult moth spreads about 1 inch from tip to tip, front wings mottled grayish-brown, hind wings pinkish white, almost transparent.

Injury in North Carolina.—In 1899 (before the writer was engaged in work in the State) this species was destructive in the southeastern part, being reported to the U. S. Department of Agriculture from several

localities.

In 1902 (August 23) it was reported from Duplin County, and as the letter well illustrates the work of the species, we quote:

"Crab-grass came up all between the peas and the outlook for a fine crop of hay was very good, but two or three weeks ago a small striped worm appeared and has literally stripped the grass, leaving stems only; are beginning to cut the peas; they are here by millions."

But during the present century, at least, there has been no year in which the area and severity of its ravages could compare with that of 1912, when it was indeed a severe scourge in many localities in our State.

Outbreak of 1912.—The first positive report of Fall Army-worm in 1912 came July 20, from Chadbourn, Columbus County, where it was reported as eating young corn. The last complaint was October 26, from Pilot Mountain, Surry County, where it was attacking rye. The complaints were, however, divided approximately into three series, which we believe did actually indicate three successive destructive broods of the worms. The first series of complaints covered the period from July 20 to August 3. The second series began August 17 and ended August 26. The third series of complaints opened September 25 and closed October 26. There were no complaints dated between August 3 and 17, nor between August 26 and September 25. The last series contained only three complaints (September 25, 27, and October 25), of which the last might possibly represent a fourth destructive generation of worms, though probably not.

Many of the complaints indicated no particular crop, but among the crops which were definitely reported as suffering were corn, grass, soy

beans, peanuts, peas, alfalfa, rye, cane, potatoes (kind not specified), and cotton. But the cotton farmer who reads this account should bear in mind that this Fall Army-worm is not the same as the cotton caterpillar which stripped cotton throughout the Sate in 1911.

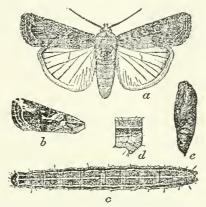

Fig. 13.—Fall Army-worm. a, adult moth; b, wing, showing variation in markings; c, larva or "Fall Army-worm"; d, part of body of worm, from side; e, pupa.

d is twice natural size; others one-fourth larger than natural size.

(After Chittenden, Bur. Ent., U. S. Dept. Agr.)

While the injury and complaint regarding Fall Army-worm was especially severe in 1912, it is interesting to know that the insect is really common with us every year, though only occasionally do the caterpillars appear in such destructive hordes. Thus, in 1906 we have undoubted evidence that the insect was abundant, though no complaint of it reached us. In that year Mr. C. S. Brimley of Raleigh, an insect collector, was collecting moths by attracting them to trees on which a sugar mixture had been smeared. He noted that the adult moths of this Fall Armyworm were very abundant, counting "about 600 of these moths on five sugared trees on August 23, and they were present in same numbers the next two nights. The same five trees were visited by about 300 moths on the night of October 3." Mr. Brimley records the occurrence of the moths at Raleigh from late July to early November. These observations and notes were made and published by Mr. Brimley over three years before the outbreak of 1912. I present this data here as proof to our farmers that the severe outbreak of 1912 was not by a "new insect," but by one which is present every year, and similar outbreaks may occur any year when conditions are suited to the insect. Yet the moths are free fliers and may wander or migrate for some distance before laving eggs, so that a brood of worms in one locality may yield moths which will produce another brood of worms in some other locality. Study of the distribution of complaints received in 1912, in connection with the dates, might indicate this, but we will not take the space.

¹Entomological News, Jan., 1909, p. 35.

Life-history.—Briefly put, the life-history seems to be about as follows: The winter is believed to be passed mainly in the pupa stage an inch or two below the surface of the ground. Moths emerging from these in spring or early summer lay eggs from which a brood of worms hatch. These, when grown, go underground and change to pupe, from which another brood of moths emerges later. How many distinct broods may thus be produced we do not know, but as the worms feed ravenously and grow rapidly, there are certainly several broods, the later broods (July to October—our records) being more likely to be destructive.

REMEDIES.

The outbreak of 1912 extended through many of the southern states and called forth a special appropriation and special investigation by the U. S. Department of Agriculture. In August, 1912, the U. S. Department issued Circular No. 40 (revised), upon which this account of remedies is based.

Poisoning the Worms.—In making applications of poison to kill the worms, it must be remembered that the vegetation which is so treated is not to be used as forage. Hence this method is more applicable to waste places, or in the edges of cornfields rather than wholesale over entire forage crops. Paris-green or arsenate of lead may be used, either as a dust application or in water as a spray. As Paris-green is better known and more available, we discuss it first, although the arsenate is considered to be really more effective.

Paris-green, Dry.—Mix Paris-green with lime or flour at rate of 1 lb. to 4 lbs. of lime or flour. The worms eat it more readily if mixed with flour, but it is less likely to hurt leaves if mixed with lime. Take your choice. Dust the plants until whitened.

Paris-green, Spray.—Mix Paris-green with water at rate of 10 ounces to 50 gallons, adding 2 lbs. of freshly slaked lime. Spray liberally, endeavoring to reach all the leaves or blades of the plants treated.

Arsenate of Lead, Dry.—This material is more commonly sold in paste form, but the dry powdered form can be ordered, and is considered better than Paris-green because it can be dusted on pure without injury to the leaves. It will be cheaper to mix it with equal or twice its weight of flour.

Arsenate of Lead, Spray.—If the powdered form is to be used as a spray, mix with water at rate of 2 lbs. to 50 gals. water. If the paste form is to be used, use 4 lbs. to 50 gals. water; spray thoroughly.

Poison Bait.—This method gives a chance to poison the worms without applying it to plants at all, so the plants can be used as forage afterwards. Mix 2 to 3 lbs. of either Paris-green or (powdered) arsenate of lead with 100 lbs. wheat bran. Add 2 gals. syrup, and water enough to moisten; mix thoroughly, and distribute on ground where worms are.

Barriers.—If a deep furrow be plowed ahead of the moving worms, or around fields to be protected, or around the area where the worms are, so as to confine them, they find it somewhat difficult to cross the obstruction. In all cases list toward the worms, so they will have to climb the steep side of the furrow. If it is desirable or seems necessary to destroy them as they gather in the furrow, a log may be dragged along in the furrow from time to time, or they may be killed by application of kerosene or a blast-torch, or occasional post-holes in bottom of the furrow will concentrate many where they may be crushed.

Cultivation.—As the worms go underground only an inch or so to change to the pupa stage, many of them may be killed or at least disturbed in this process by thorough shallow cultivation, or disking the land where a brood of worms has matured and just disappeared. This would need to be done soon after the worms enter the earth, for in the course of a week or two they will have issued as moths, and then the work would be absolutely useless.

When Army-worms have developed in large number, and especially when they begin to move from one field to another, they require immediate and thorough action. It may require the labor of every available hand for a day or two to keep them in check; but fortunately the duration of each brood is short, and much depends upon detecting the trouble early before the worms are widespread, and taking prompt action then. While we have discussed the remedies for both kinds together, it is to be remembered that there are two distinct Army-worms which may attack corn, the "Army-worm" being more in the western part of the State, more confined to grasses and grains, and more apt to remain in dense "armies." The Fall Army-worm is more prevalent (according to present evidence) in the eastern and southern parts of the State, feeds on a greater variety of crops, and is more inclined to scatter instead of remaining in compact swarms.

THE SUGAR-CANE BEETLE. (Ligyrus rugiceps, Lec.) Order Coleoptera. Family Scarabæidæ.

Description.—A pitch-black beetle about one-half inch long, of somewhat the shape of our green "June Bug"; attacking corn at or about the surface of the ground, eating into the stalks.

Injury in North Carolina.—Records of the U. S. Department of Agriculture at Washington show that in June, 1885, this insect was reported from Monroe, Union County, with the statement that it was new to the farmers there.

On May 30, 1904, Dr. E. S. Credle, Pantego, Beaufort County, made complaint of this pest. As our correspondence at that time covered most of what is (even now) known of the insect in this State, it is given in some detail. His first letter was as follows:

I send you under separate cover a bottle of bugs that are destroying the corn crop in this township. Please let me know what they are and if there is any remedy for them.

REPLY.

- * * * It is the Sugar-cane Beetle, which is regularly destructive in Louisiana, but of which I have never had any complaint during the four years I have been in this State. As its name indicates, it is known primarily as a pest of the sugar-cane. * * * * A most careful search of the literature fails to reveal any reference to remedies which have been found effectual, and I guess we must put it among those (pests) against which we have little or no means of defense. It has been suggested that the beetles are attracted to lights, and I would suggest that you hang a brightly burning lantern in your cornfield suspended over a pan in which is tar, or water and kerosene.
- * * Now this will be an experiment merely. I am not even sure that it will attract a single one of the insects, but I think that the test will be well worth making. * * * Please also try to give me some information on the following points: (1) How many years have you known this pest? (2) How long has it been with you this season? (3) Where and how does it attack the plant (living specimens with plant would furnish best answer)? (4) How abundant is it in the fields—how many at each hill on an average?
- * * * Any observations that you can make, or specimens that you can obtain, bearing on the life-history or habits of the insect will be of interest and value. (June 4, 1904.)

Dr. Credle's next letter was dated June 9, 1904, and was as follows:

* * I have tried the lantern and water and kerosene, also the tar, but had no success; did not get a dozen bugs in three nights. These bugs first appeared here last year about the middle of May, and after the first big rain we had they disappeared. They returned this season, first of April, and are here yet and very numerous, from eight to ten to the hill of corn. I send you under separate cover, bugs with a sample of the different sizes of corn and cotton that they are at work on. * * * You will notice they do their work right at the root, and they can kill corn any size. The outlook is that they are going to be the most destructive pest that we have ever had. Hope there may be some way to destroy them.

REPLY.

* * I would like to make a few other suggestions as to remedies, and if you find it convenient to try them I hope you will report results: (1) the sprinkling of a little wood-ashes about the base of the plants, say a handful to each hill; (2) same, using air-slacked lime; (3) pine sawdust, which should be fresh enough to have a strong tar or pitch odor. If you try any of these methods I would advise that you use them only on a small scale, as it will likely prove useless in any case, and it would scarcely be advisable for you to go to any great trouble in a mere experiment. (June 11, 1904.)

Dr. Credle's next letter is dated June 14, 1904, and from it the following is taken:

* * * I am still of the impression that they are dry-weather bugs. The part of the township (where) they are doing the worst damage there has been no rain since March. There has not been enough rain since the first

of April to lay the dust, but I have noticed for the last few days they (the bugs) are dying; can see them all about in the field dead. Will try the remedies you suggest and report.

On June 6, 1905 (a year later), Dr. Credle wrote:

* * My corn crop last year was so completely destroyed by the beetles that I had what was left plowed up the first of June and planted over on the 7th and Sth. This last crop was not bothered in the least by them, and I made a good crop. They have been there all winter. When the corn was being housed in December we would often find them under the shuck, eating the corn. * * * They have destroyed corn for me this season, but not so bad as last. The only places they bothered this year to any amount was where I raised hay last year. But they have stopped now, and I don't think they will bother further this season. Several of my neighbors have had to plow up and plant over this season, that were bothered very little last year. I did not use any of the remedies, as I did not have any cause to do so in the last planting. Did not make any observation on the egg-laying habits, but as they seem to bother more where that old dead grass was plowed in, that must have been the place where they laid (very likely!). I am satisfied that they do but little damage after June 1st.

Dr. Credle also stated that the insects seemed very fond of irish potatoes, and that while breaking ground they often found them eating the volunteer potatoes in the spring.

Mr. J. P. Clark, of Pantego, also wrote (June 2) in 1905, stating that farmers were again troubled with this Cane-beetle; that some of the land had to be plowed and replanted.

This time we were able to make some observations in the field. Mr. G. M. Bentley (at that time assistant) was sent to Pantego to examine the conditions. His observations are dated June 14, 1905. The first field examined had been much damaged and replanted, the corn then being nearly 6 feet high; only a few of the beetles were found, and injury was not much in evidence. In the second field the corn had been planted for the third time of the season and was smaller; a considerable number of the beetles were found eating the young stalks. The third field examined was that of Dr. Credle, from whom we have already quoted. A number of beetles were found (after careful search), as many as five on one stalk, working at, or just beneath, the surface of the ground. Observations in different parts of the field showed that "noticeably more beetles were at work in a certain portion of the field where 'bull-grass' had been plowed in. The beetles were found mating in several instances." Specimens sent by Dr. Credle, June 9, 1904, were mating in box when received.

Since the outbreak of 1904 and 1905 in Beaufort County we have had only one complaint, this coming in June, 1912, from Greenville, Pitt County; but there was no indication that the damage was widespread or long continued.

DISCUSSION OF THE INSECT.1

Fig. 14.—Sugar-cane Beetles. A row of the adult insects, natural size. See also figure on front cover of this Bulletin (original).

The complete life-history of this insect does not appear to be known, the laying of the eggs, appearance of grown larvæ, and methods of pupation, all being unsettled points. Most of the observations that have been made on the insect have been made in Louisiana and Mississippi, and here the habits and life-history might be slightly different. If the larva lives on the roots of the sugar-cane in Louisiana, it may live on roots of grasses, as Dr. Credle intimates, or sorghum-cane, some species of wild reed or rush, or perhaps on corn itself, in this State. As to its being primarily a dry-weather insect, as intimated by Dr. Credle, the natural habitat of the insect in the low cane-lands of Louisiana would seem to show that if anything it should prefer a damp climate. Observations made in Mississippi seemed to show it to be worse in wet lands, and this would seem to be a natural occurrence. In June, 1886, Mr. G. W. Smith-Vaniz, of Canton, Miss., in writing to the U.S. Department of Agriculture at Washington, sent eggs found in soil near corn where the beetles were at work, and which were similar to eggs dissected from the bodies of female beetles. Mr. Smith-Vaniz also hatched out young larvæ; but there the observations seem to cease.

We have in our collection one specimen of the adult beetle which was taken at Gastonia, Gaston County, on May 30, 1902.

As to the possibilities of this insect becoming a regular and serious corn pest in this State, it seems reasonable to infer that its injuries will probably be confined chiefly to the eastern part of the State, in what is commonly known as the coastal region, and its outbreaks, however serious at times, will probably be of irregular and infrequent occurrence. How long it has already been in the State no one can tell with certainty. The injury to cotton and potatoes, as reported by Dr. Credle, is probably unusual and occurs only when the beetles are exceedingly abundant.

REMEDIES.

Late planting, liberal fertilization, and cultivation are the only palliatives that we can suggest which are at all certain to yield results. It is

¹An article on this insect from which this account is largely drawn (other than our own notes and observations) was published by Dr. L. O. Howard, U. S. Entomologist, in Insect Life, Vol. 1, pp. 11-13, 1889.

to be observed that corn planted June 7th and 8th, 1904, made a good crop at Pantego, and in 1905 the insects were disappearing as early as June 6th. Dr. Credle's observation of their being worse on land just from grass suggests the advisability of avoiding such lands for corn.

Although the insects seem to be attracted to lights at times, this habit does not seem to tempt them to leave the plants when feeding and can-

not be relied upon to lure them to their destruction.

See Rotation (p. 6), Fertilization (p. 7), Time of Planting (p. 7), Cultivation (p. 8).

THE CORN EAR-WORM. (Heliothis armigera, Hub.) Order Lepidoptera. Family Noctuida.

Description.—A grayish, greenish, reddish or brownish caterpillar (very variable in color), about one and a quarter inches long when grown, which eats into the ears of corn, often several in a single ear. The adult is a yellowish-brown moth with wings expanding from 1 to 11/4 inches from tip to tip.

Injury in North Carolina.—Among our destructive insects we think that this stands near the head, both in the total amount of damage done and the difficulty of combating it. According as it attacks different parts of the several crops, it is known as the Cotton Boll-worm, the Tobacco Bud-worm, the Tomato Fruit-worm, the Corn "Shatter-worm" (when in the top of corn) and the Corn Ear-worm. The insect also attacks other plants to more or less extent; has been reported burrowing in the pods of cow-peas, in the seed-pods of tobacco, and others have recorded it as occasionally eating into orchard fruits, though we have not noted this. Here we are principally concerned with its injuries to corn, and in this connection the following records are of interest:

In the latter part of May and early June, 1902, complaints were received from Mr. A. T. McCallum at Red Springs and Mr. A. J. McKimmon of Maxton, both in Robeson County. In response to these complaints the writer made a visit, giving special attention to the case at Maxton, which was especially serious. Mr. McKimmon had about thirty acres planted in sweet corn for shipment to northern markets, but scarcely an ear could be found which was not infested with several of these larvæ. As many as eleven were found in a single ear. The crop was fully 75 per cent (if not 99 per cent) lost from the ravages of this pest.

Early in January, 1903, Mr. R. W. Livermore, also of Red Springs, wrote asking about methods of combating this pest which had done him serious injury the year previous. From his letters, dated January 6th and 8th:

^{* * *} The worm which was doing the damage in my early corn last year was the worm which bores into the ear when the corn is ripening. I am inclined to think that this worm shuts out the early sweet-corn crop for this section as a shipping crop to be depended upon.

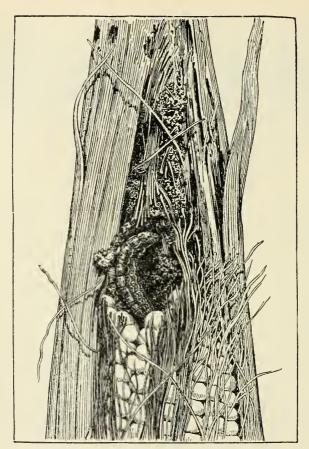

Fig. 15.—The Corn Ear-worm, showing the destructive larva at work in ear of corn.

(After Quaintance, Bureau Ent., U. S. Dept. Agr.)

Life-history and Habits. —The winter is passed in the pupa stage, under the surface of the ground. The adult moths come out in spring or early summer and, being very active fliers, wander whither they will in search of nectar-bearing flowers or suitable plants upon which to place the eggs. When corn is the object of attack the eggs are laid on the silk, though the early brood of moths often deposit them in the terminal growing part of the plant, in which case the caterpillars eat the leaves and tassel and are called "Shatter-worms." The great majority of the eggs are laid on the silk, and the larvæ work down the silk, or bore directly through the husk to the forming ear, where they feed on the kernels and soon attain full growth, when they burrow out

¹This portion of the account is based partially on Farmers' Bul. 191, U. S. Dept. Agr., by A. L. Quaintance.

FIG. 16.—The Corn Ear-worm, showing larva at work on blades of corn.
When it does this injury it is sometimes known as the "Shatter-worm."

(After Quaintance, Bureau Ent., U. S. Dept. Agr.)

through the husk and enter the ground to pupate. There are a number of broods during the summer, the last brood passing the winter in the pupa state and emerging as adults in the spring.

Corn is not much attacked after the kernels begin to harden, the insects then turning to other plants such as tomatoes, tobacco and cotton. There are several broods each season, probably four or five in the greater part of this State.

North Carolina Notes.—The notes here given throw some light on the

time of emergence, etc., of the insect in this State:

In 1900, on September 18th, Mr. D. L. Wolff, R. F. D. No. 1, Pinnacle, Surry County, sent in adult moths which were captured when on tobacco flowers.

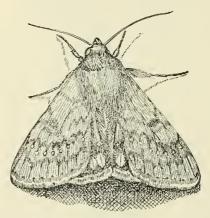

Fig. 17.—The Corn Ear-worm, showing adult moth in natural position with wings not spread. About twice natural size.

(After Quaintance, Bureau Ent., U. S. Dept. Agr.)

In 1902, at Raleigh, adults were observed for the first time in the terminal blades of corn on May 15th. On the 18th eggs were abundant on new silk (it was early corn) and thereafter larvæ were abundant in the ears.

In 1904, the writer found his first adult ear-worm moth for the season at Raleigh, on June 15, though they had likely been out some time previous. This moth was in the funnel formed by the top blades of the corn-plant which was not yet in tassel. On June 18 (same year) eggs were abundant on silk of Adams' early corn in garden, but no worms had yet appeared.

In 1905, on May 18th, Mr. S. O. Lazenby, R. F. D. No. 4, Statesville,

sent in a specimen of the adult moth.

These notes show that the adults are abroad early in the spring and also late in the summer, into the fall. The finding of larvæ mature, or

nearly so, at Maxton on May 31st (1902), is an evidence that they reach maturity quickly. There must, therefore, be quite a number of different broods.

Professor Quaintance calls attention to the fact that when the worms are abundant in corn they may devour one another, thus reducing the number which actually mature. He also observes—and the same fact is evident to all who have observed—that the damage is not measured by the corn actually eaten, but also by the large amount which rots or molds as a result of the insect's work. The holes made through the husk also serve as entrance places for weevils.

REMEDIES.

When this insect attacks other plants, it is sometimes recommended to plant an occasional row of corn for the purpose of inducing the insects to attack the corn so the other crop will be spared. This is an evidence that it prefers corn to other food. This paves the way for a frank statement of the fact that no wholly satisfactory remedy for the Ear-worm in corn is known. Such methods as may be employed with reasonable hope of relief are mentioned below.

As the insect passes the winter in the pupa state in the earth, fall or winter plowing of badly infested lands will kill many of them. Experiments in Kansas¹ "showed that plowing infested cornfields 5 or 6 inches deep in late fall and early winter destroyed practically 100 per cent of the over-wintering pupæ." But in North Carolina it must be remembered that the insect develops in many other crops besides corn, especially cotton and tobacco; hence fields in which these crops stand until freezing weather will likely be infested as well as corn lands. Indeed, if the corn matures early, the latest broods must of necessity develop on other crops, chiefly cotton, hence the plowing of cornfields only would reach only a part of the insects.

In gardens and small patches of corn, something can be done by pinching the tips of the ears by hand, or even cutting off the ends of the ears and feeding them to stock, to prevent the worms going down the length of the whole ear. If the pinching method be used, it should be done several times, to kill as many as possible, for some of the young worms will likely escape each time.

If the corn matures very early, it will not be exposed to the later broods of worms, for the moths prefer to lay eggs on fresh silk and the worms will not work readily in hardened kernels. Thus early planting, and the use of early maturing varieties, would seem to be against the insect; but we must remember that early planted corn is, in general, more hurt by a number of other corn pests, and we do not believe, as yet, that the benefit of very early planting against this insect will amend

¹Cir. No. 7, Kans. Exp. Sta., "Corn Ear-worm," by T. J. Headlee (1910?).

for its other disadvantages. We can conceive that any one planting in any one year might largely escape ear-worm by not being in tender silk when the adult moths were out in numbers. But we are not able to forecast the broods with sufficient exactness (nor can we know the rate with which the corn will grow) to make any positive recommendations on this point.

Let us hope that better remedies may be developed in the future.

WEEVILS (Several Species). Orders Lepidoptera and Coleoptera.

Description.—Small or medium-sized insects which in the adult or larval state, or both, injure grain by eating into the kernels when stored, or by eating the meal or other products. Sometimes attack corn in the field before harvest. Often troublesome in mills, barns, stores, pantries, etc. The adult insects are moths or beetles.

Injury in North Carolina—There are from eight to a dozen distinct kinds of "grain weevils" in North Carolina, and the total damage by them is great. Prof. R. I. Smith during some special studies of our grain weevils recorded at least nine species as known to him.¹ These were:

(Lepidoptera) (Moths): Angoumois Grain Moth,
Indian Meal Moth,
Meal Snout Moth.
(Coleoptera) (Beetles): Saw-toothed Grain Beetle,
The Cadelle,
Yellow Meal-worm,
Dark Meal-worm,
Granary Weevil,
Rice Weevil ("Black Weevil").

Undoubtedly the most destructive "weevil" to our corn is the last one in the above list—the "Rice Weevil" or "Black Weevil." It has been sent in to us more often than any other kind. It appears to be the hardest of all the weevils to control. It also often infests the corn in the field, as the following letter from the southeastern part of the State, received August, 1912, shows:

"A year ago a large quantity of corn here was destroyed by weevils before taken from the field. This year a great deal of the early corn has one or two dozen weevils on each ear, and as the corn hardens it is being damaged."

Many other letters could be quoted showing this same general condition.

¹Bul. 203, N. C. Exp. Sta., "Corn Weevils and Other Grain Insects." R. I. Smith, May, 1909.

General Life-history of Grain Weevils.—As there are a number of distinct kinds of grain weevils, some seeming to prefer ground grain products, the life-histories vary in details. The account here given is only meant to be general, giving an approximate idea of the whole group.

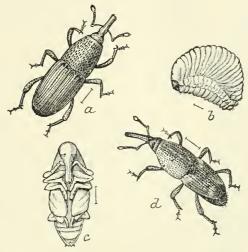

Fig. 18.—Grain Weevils (beetles), showing two closely related species at a and d; a larva at b, and pupa at c. Natural size indicated by lines. The one at d is the "Black Weevil," our most destructive corn weevil.

(After Chittenden, Div. Ent., U. S. Dept. Agr.)

The adult insects are moths or beetles, mostly small, but a few of medium size. These lay eggs on or in the grain or husk and the worms eat into the kernels. In some species the worm reaches full growth in the same kernel in which it first hatches; in others the same worm may live in several different kernels. When grown, the worm changes to a pupa from which the adult moth or beetle emerges later. In the case of weevils infesting meal, bran, and other ground materials, the worms burrow around in the material, frequently spinning a web which fastens little masses together. Meal and other products thus infested are apt to become moldy and unhealthy as food for both man and beast. Where the whole grain is infested, the vital germ is often eaten out, thus spoiling the grain for seeding purposes.

In the previous Bulletin of this Department on "Corn Insects" the writer stated that adult weevils had been found "passing the winter in the remnants of fodder where this had been pulled," but he has not now the original note at hand. His recollection is that it was the "Black Weevil," found in winter in the husk remaining attached to the stalk.

REMEDIES.1

Prevention.—Thorough cleaning out of old bins, sweeping out stray shattered grains, chaff, litter, etc., will get rid of many of the Weevils

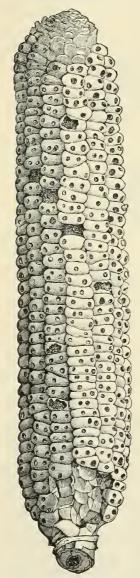

Fig. 19.—Ear of corn riddled by Angoumois Grain Moth. A case of excessive injury.

that are breeding in the bins so as to give the new crop a start with fewer Weevils to contend with in the beginning (save those in the corn when brought from the field).

The letter already quoted showed special damage to the early corn. Professor Hinds in Alabama in the bulletin already referred to, stated that up to midwinter his records showed "about fifty times as many Weevils on early corn as on late corn."

It is commonly believed in this State (and Professor Hinds mentions the same for Alabama) that corn stored in the husk is not so liable to Weevil attack. Prof. R. I. Smith, in the North Carolina Bulletin already referred to, calls attention to the fact that tight-fitting husks do appear to protect the corn to some extent. But the ear-worm has already often eaten holes through the husks so that Weevils gain entrance, and once the Weevils are in, the writer maintains, as in his previous Bulletin, that the husk merely hides the injury and causes the farmer to think that there is less Weevil. Professor Hinds says that the value of the husk as a protection depends on the length and tightness of the husk. On this point of storing in husk, we think we are safe in saying that it is not to be relied upon, except for those ears which have long tight husks. To depend on preventing Weevil merely by storing the whole crop in husk will result in many disappointments, for many of the ears will have torn or damaged husks, or ears protruding beyond the husk, etc., which will merely invite Weevil to enter.

Farmers in this State have also told us that if the corn be slightly dampened when stored (in husks) that it undergoes slight heating which seems to protect it from Weevil. Use of salt, ashes, lime, and cedar or pine twigs for

¹In this account I have drawn upon Bul. 203, N. C. Exp. Sta., by R. I. Smith, already referred to, and on Bul. 176, Ala. Exp. Sta., "Reducing Insect Injury to Stored Corn," by W. E. Hinds, Feb., 1914.

putting in bin with the corn have all been mentioned, and must be classed among the remedies or preventives that have not been adequately proven. In his former Bulletin the writer stated that "shelled corn may be placed in absolutely tight bins and top of each bin covered with a complete layer of lime or ashes to depth of an inch. Of course, this is only practicable for those bins that are not being continually disturbed." This suggestion is not based on actual tests, but only as a chance to keep the Weevils out, and would be in no sense a remedy for those already in the corn.

Fumigation Treatment.—But for the Weevils that are already in the corn, or the ones that may gain entrance after it has been stored, we know of no treatment other than fumigation with some poisonous gas that can be relied upon, and some recent testimony shows this to be less certain than was formerly believed!

For this purpose the material known as carbon bisulphide (or carbon disulphide) has long been, and still is, the standard material. It is a clear, foul-smelling liquid which evaporates rapidly, giving off poisonous fumes. It is necessary to have the grain in some tight receptacle, absolutely tight if possible, or at least as near to it as possible. For small quantities, as for seed grain, etc., a water-tight barrel or cask can be used, or boxes if cracks and covers be sealed by pasting paper closely over them. The tighter the better, and the less the barrel, box, or bin approaches to perfect tightness the less perfect you must expect the result to be, and the greater amount of the material you must use in the effort to make amends for leaking of the gas.

A brand of the chemical especially made for insect work is manufactured by E. R. Taylor, Penn Yan, N. Y., under the name of "Fuma Carbon Disulphide," and is sold in lots of 50 lbs. or more. In small quantities the chemical can be had from, or ordered through, many drug stores, at retail prices of about 30 cents per pound (pint).

The amount to use is figured on the air space in the barrel, box, bin, or room (not merely on the amount of grain). Professor Hinds in Alabama says this should be at the rate of 5 to 8 lbs. for 1,000 cubic feet of space if the room or bin is quite tight, varying up to as high as 20 or 25 lbs. per 1,000 cubic feet of space if only moderately tight as by lathing the cracks, and says that for use in barrels ("for peas") "about one-half teacupful is sufficient if the top be tightly covered." The "Black Weevil" in corn may require more than this amount, perhaps three-fourths of cupful.

Professor Hinds says: "In making the application, level the surface and prepare small holes about a foot deep, about 3 to 4 ft. apart. Divide the liquid among these holes; pour direct on the corn in the holes and fill the holes with corn." If the room is large, begin on the farther end, working toward the door. "Close door tightly and quickly paste paper over the cracks; leave closed for at least 24 hours; no harm

if left indefinitely; fumigation is more effective during warm weather; never attempt it when temperature is below 60 degrees. A second treatment (stronger) should be given after a week or two if it appears that the first was not effective."

Prof. R. I. Smith, after working in North Carolina, became convinced "that carbon bisulphide, at any reasonable strength, cannot be successfully used in *ordinary* corn cribs, grain boxes, or storerooms. Small quantities can be fumigated in absolutely tight boxes or barrels by using about one ounce to three bushels; the top must be air-tight, not simply covered with blankets or canvas. Fumigation should continue for about 24 hours." He found that some stages of the insects would survive treatment; especially eggs and pupæ.

Which leads the present writer to insist that one may expect imperfect results, but still this fumigation method is the best known when once the corn is infested. Have the corn free to begin with, if possible, by cleaning the bins, and perhaps even throwing out ears already visibly infested; have the bins tight, so that they can be fumigated if necessary; use enough of the bisulphide to make allowance for leakage through such cracks as there may be; and finally, if the treatment seems not to have killed all, give a second treatment a week or two later to kill larvæ and adults which may have developed from eggs or pupæ which survived the first treatment.

Caution.—Carbon bisulphide is like benzine in its nature, both the liquid and its fumes being very inflammable, and no light or fire of any description can be brought near while the fumigation is going on, not even a lamp, cigar, or pipe. After the fumigation is over, open the bin (box, or room) and air out. If these cautions are heeded the material is safe to use.

Heat.—It has long been known that insects are killed by high temperatures, and this fact has been made use of recently in some striking tests by Mr. George A. Dean of the Kansas Experiment Station in ridding flour-mills of insects by the heat method. In summarizing his work, he says:

"A temperature of from 118 to 125 degrees is sufficient for any part of the mill. This temperature should be held several hours to allow the heat to penetrate all the infested parts (of the mill)." But he also says: "I would not recommend heat for killing insects in stored seeds and grain. In case they are stored in small quantities, the heat method would be entirely satisfactory; but if in large quantities it would require too much heat to penetrate to center of bins."

LESSER CORN INSECTS.

We have devoted the greater part of this Bulletin to those insects which are regular serious pests of corn in this State. It now remains to make brief mention of a few which are of minor importance or which

¹Jour. Ec. Ent., Vol. 6, p. 40, Feb., 1913.

are only occasionally destructive. For these we enter into no lengthy discussions either of injuries, life-histories, or remedies.

Seed-corn Maggot (Order Diptera).—A white maggot infesting seeds of corn, preventing germination. Once reported from Forsyth County as damaging corn which had been planted, and presumably the same once reported from Rowan County infesting planted seeds of melons. The attack is made after the seed is planted. The adult insect is a gray slender fly, smaller than house-fly. Remedies not very available, and in this State not much needed.

Flea-beetles and Leaf-beetles (Order Coleoptera).—Several species of these are known to attack young corn, eating the blades. Several complaints have been made in this State, but injury never widespread and usually not serious. Adult insects (which do the damage) are small, usually shining beetles, often jumping or dropping quickly when disturbed. Remedies scarcely necessary. Dusting with ashes, or with Paris-green in ashes or lime (1 ounce to 1 lb. ashes) would probably drive many away.

Red Spider (not a true insect).—This small creature is related to the spiders, mites, and ticks. Primarily a pest on cotton, sometimes on corn, peas, etc., especially in long hot spells. Rainy weather checks them.

Grasshoppers (Order Orthoptera).—We have many native kinds which feed on corn, but usually not destructive and the injury is soon outgrown. Some appear full-winged in spring, others are in young wingless state in spring and develop wings in summer and fall. When serious they can be combated by use of poisonous baits.

Lady-beetles (Order Coleoptera).—One of our most common Lady-

Fig. 20.—Lady-beetle (Megilla maculata) from which a parasite has emerged and spun its cocoon beneath the insect. Slightly enlarged, size of beetle indicated by line above. Lady-beetles of this species parasitized in this way may frequently be found on blades of corn. (After Riley, Div. Ent., U. S. Dept. Agr.)

beetles is frequently seen on corn where it feeds to some extent on the pollen, blades, and the soft kernels. This is the Thirteen-spotted Lady-beetle (Megilla maculata). The species also feeds to some extent on other insects, and its larva is entirely insectivorous in its diet, feeding on plant-lice, slugs, etc. Frequently specimens of this beetle may be found on blades of corn standing over a small silken cocoon of yellowish or brownish color.

Such a cocoon contains a parasite, the larva of which has issued from the beetle. In a few days the adult parasite emerges from the cocoon as a small winged wasp-like creature, which goes off to seek a Lady-beetle victim. The beetle invariably dies soon after the parasite emerges.

Stinging Caterpillars (Order Lepidoptera).—There are two kinds of caterpillars frequently found on corn which if brushed against carelessly may produce painful stings. One of these is known as the Saddle-back

Caterpillar (Sibenne stimulea), so called from the peculiar saddle-like markings in the middle of the back. This caterpillar when grown is about an inch long. There are two projections at each end of the body which are directed upward and outward, and these projections as well as other parts of the body are armed with sharp brittle spines which readily pierce the skin and break off. The general color of the larva is greenish, with a reddish-brown patch resembling the saddle, and a similar patch at each end of the body from which the projections arise. The caterpillar when grown spins a cocoon from which it comes out as a brownish moth. There seems to be but one annual brood, the adult moths issuing in spring or early summer. Ammonia, bicarbonate of soda, or even strong brine, are recommended as antidotes for the sting.

Our other species of stinging caterpillar is the larva of the Io Moth (Automeris io). This is a rather handsome pea-green caterpillar attaining a length when full grown of two inches, with a purple stripe down each side of the body, the whole body armed with yellowish spines which are borne in clusters on little warts or tubercles. When grown the larva spins a brownish silken cocoon within which it transforms to a handsome moth, the males being yellowish and expanding two inches from tip to tip of the wings, and the females yellowish-brown and expanding as much as three inches in large specimens. In both sexes the hind wings are marked with conspicuous eye-spots.

Other Caterpillars (Order *Lepidoptera*).—Various caterpillars of many kinds may be found on the corn plant, all transforming to moths of some kind. Most of these, however, are not serious, or, if so, are only destructive in sporadic outbreaks.

* * *

In concluding this Bulletin it is but fair to repeat that in its preparation the writings of others have been freely drawn upon. Without crediting each statement made, the author has named the principal papers in footnotes. Many of our own observations are also included. It would take years and years of concentrated effort for any one person to work out all such facts as have been here recorded on the insects attacking this one crop—corn. But the writer is persuaded that there is a proper demand for bulletins of this type, each discussing all the more important insect pests of some one important crop. Such a bulletin cannot always be made up entirely of facts ascertained, proven, and tested by the writer in person.

The writer will welcome correspondence with corn-growers who make use of the suggestions contained herein, and who carefully watch the results. He also desires to be promptly informed in case of any serious outbreak of any corn pest not mentioned in these pages.

LETTER OF TRANSMITTAL.

Hon. W. A. GRAHAM,

Commissioner of Agriculture.

Sir:—I submit herewith analyses of fertilizers made in the laboratory of samples collected during the spring. These analyses show fertilizers to be about as heretofore, and to be, generally, what was claimed for them. I recommend that it be issued as the June Bulletin.

Very respectfully,

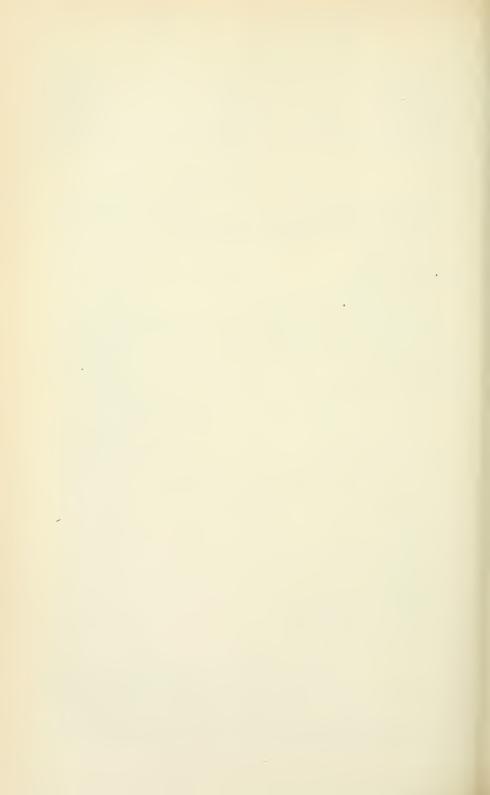

B. W. KILGORE,

Approved for printing:

State Chemist.

W. A. GRAHAM,

Commissioner.

I. ANALYSES OF FERTILIZERS—SPRING SEASON, 1914.

BY B. W. KILGORE, W. G. HAYWOOD, J. Q. JACKSON, E. S. DEWAR, AND J. R. MULLEN.

The analyses presented in this Bulletin are of samples collected by the fertilizer inspectors of the Department, under the direction of the Commissioner of Agriculture, during the spring months of 1914. They should receive the careful study of every farmer in the State who uses fertilizers, as by comparing the analyses in the Bulletin with the claims made for the fertilizers actually used, the farmer can know by or before the time fertilizers are put in the ground whether or not they contain the fertilizing constituents in the amounts they were claimed to be present.

TERMS USED IN ANALYSES.

Water-soluble Phosphoric Acid.—Phosphate rock, as dug from the mines, mainly in South Carolina, Florida, and Tennessee, is the chief source of phosphoric acid in fertilizers.

In its raw, or natural state, the phosphate has three parts of lime united to the phosphoric acid (called by chemists tri-calcium phosphate). This is very insoluble in water and is not in condition to be taken up readily by plants. In order to render it soluble in water and fit for plant food, the rock is finely ground and treated with sulphuric acid, which acts upon it in such a way as to take from the three-lime phosphate two parts of its lime, thus leaving only one part of lime united to the phosphoric acid. This one-lime phosphate is what is known as water-soluble phosphoric acid.

Reverted Phosphoric Acid.—On long standing some of this water-soluble phosphoric acid has a tendency to take lime from other substances in contact with it, and to become somewhat less soluble. This latter is known as reverted or gone-back phosphoric acid. This is thought to contain two parts of lime in combination with the phosphoric acid, and is thus an intermediate product between water-soluble and the original rock.

Water-soluble phosphoric acid is considered somewhat more valuable than reverted, because it becomes better distributed in the soil as a consequence of its solubility in water.

Available Phosphoric Acid is made up of the water-soluble and reverted; it is the sum of these two.

Water-soluble Ammonia.—The main materials furnishing ammonia in fertilizers are nitrate of soda, sulphate of ammonia, cotton-seed meal, dried blood, tankage, and fish scrap. The first two of these (nitrate of soda and sulphate of ammonia) are easily soluble in water and become

well distributed in the soil where plant roots can get at them. They are, especially the nitrate of soda, ready to be taken up by plants, and are therefore quick-acting forms of ammonia. It is mainly the ammonia from nitrate of soda and sulphate of ammonia that will be designated under the heading of water-soluble ammonia.

Organic Ammonia.—The ammonia in cotton-seed meal, dried blood, tankage, fish scrap, and so on, is included under this heading. These materials are insoluble in water, and before they can feed plants they must decay and have their ammonia changed, by the aid of the bacteria of the soil, to nitrates, similar to nitrate of soda.

They are valuable then as plant food in proportion to their content of ammonia, and the rapidity with which they decay in the soil, or rather the rate of decay, will determine the quickness of their action as fertilizers. With short season, quick-growing crops, quickness of action is an important consideration, but with crops occupying the land during the greater portion or all of the growing season, it is better to have a fertilizer that will become available more slowly, so as to feed the plant till maturity. Cotton-seed meal and dried blood decompose fairly rapidly, but will last the greater portion, if not all, of the growing season in this State. While cotton seed and tankage will last longer than meal and blood, none of these act so quickly, or give out so soon, as nitrate of soda and sulphate of ammonia.

Total Ammonia is made up of the water-soluble and organic; it is the sum of these two.

The farmer should suit, as far as possible, the kind of ammonia to his different crops, and a study of the forms of ammonia as given in the tables of analyses will help him to do this.

VALUATIONS.

To have a basis for comparing the values of different fertilizer materials and fertilizers, it is necessary to assign prices to the three valuable constituents of fertilizers—ammonia, phosphoric acid, and potash. These figures, expressing relative value per ton, are not intended to represent crop-producing power, or agricultural value, but are estimates of the commercial value of ammonia, phosphoric acid, and potash in the materials supplying them. These values are only approximate (as the costs of fertilizing materials are liable to change, as other commercial products are), but they are believed to fairly represent the cost of making and putting fertilizers on the market. They are based on a careful examination of trade conditions, wholesale and retail, and upon quotations of manufacturers.

Relative value per ton, or the figures showing this, represents the prices on board the cars at the factory, in retail lots of five tons or less, for cash.

To make a complete fertilizer the factories have to mix together in proper proportions materials containing ammonia, phosphoric acid, and potash. This costs something. For this reason it is thought well to have two sets of valuations—one for the raw or unmixed materials, such as acid phosphate, kainit, cotton-seed meal, etc., and one for mixed fertilizers.

The values used last season were:

VALUATIONS FOR 1913.

In Unmixed or Raw Materials.

For phosphoric acid in acid phosphate		
For phosphoric acid in bone meal and Peruvian Guano.	$3\frac{1}{2}$	cents per pound.
For phosphoric acid in basic slag		
For nitrogen		
For potash	4	cents per pound.

In Mixed Fertilizers.

For phosphoric acid	$4\frac{1}{2}$	cents per pound.
For nitrogen	21	cents per pound.
For potash	5	cents per pound.

VALUATIONS FOR 1914.

In Unmixed or Raw Materials.

For phosphoric acid in acid phosphate	4	cents per	pound.
For phosphoric acid in bone meal and Peruvian Guano			
and basic slag	4	cents per	pound.
For nitrogen	$19\frac{1}{2}$	cents per	pound.
For potash	4	cents per	pound.

In Mixed Fertilizers.

For phosphoric acid	 $4\frac{1}{2}$	cents per pound.
For nitrogen	 21	cents per pound.
For potash	 5	cents per pound.

HOW RELATIVE VALUE IS CALCULATED.

In the calculation of relative value it is only necessary to remember that so many per cent means the same number of pounds per hundred, and that there are twenty hundred pounds in one ton (2,000 pounds).

With an 8-2-1.65 goods, which means that the fertilizer contains available phosphoric acid 8 per cent, potash 2 per cent, and nitrogen 1.65 per cent, the calculation is made as follows:

Percentage or Lbs. in 100 Lbs.	Value Per 100 Lbs.	Value Per Ton, 2,000 Lbs.
8 pounds available phosphoric acid at 4½ cents	$0.36 \times 20 =$	\$ 7.20
2 pounds potash at 5 cents	$0.10 \times 20 =$	2.00
1.65 pounds nitrogen at 21 cents	$0.347 \times 20 =$	6.94
•		
Total value	$0.817 \times 20 =$	\$16.14

Freight and merchant's commission must be added to these prices.

LETTER OF TRANSMITTAL.

RALEIGH, N. C.

Hon. W. A. Graham, Commission of Agriculture.

Sir:—I beg to submit herewith manuscript on Hog Cholera and its prevention by the use of anti-hog cholera serum. I recommend that this manuscript be published as the July Bulletin.

B. B. Flowe, State Veterinarian.

Approved for publication. W. A. GRAHAM,

Commissioner of Agriculture.

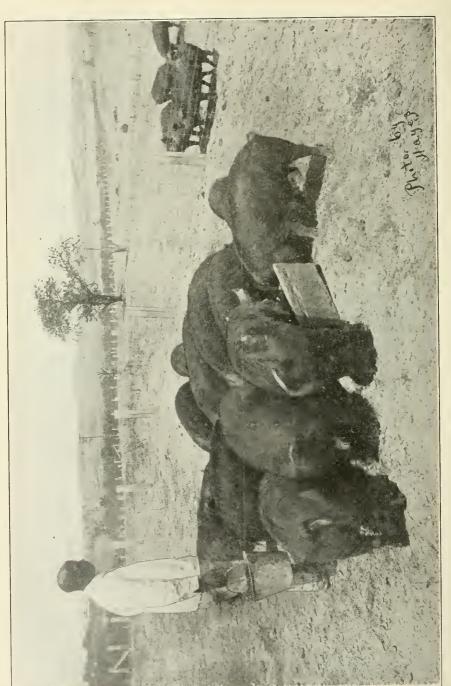

FIGURE 1.—Group of pure bred Berkshires (immuned).

HOG CHOLERA

BY B. B. FLOWE, STATE VETERINARIAN.

Hog cholera is a highy contagious and infectious disease of hogs. It is characterized by high fever, ranging from 104 to 107 degrees Fahrenheit, loss of appetite, red or purple spots on the belly between the forelegs and on the ears, and a muco-purulent discharge from the nose and eyes. This discharge often pastes the eyelids together, and causes a snuffling sound in breathing. In the last stage of the disease, and just before death, the animal has muscular tremors and wobbling gait.

PERIOD OF INCUBATION.

The period of incubation is the number of days between contracting the germ causing hog cholera, and the manifestation of the first symptoms or evidence of sickness. This time ranges from four to twenty-one days, depending on the susceptibility of the individual hog and the virulence of the infection.

An acute form of hog cholera indicates a virulent form of infection, while a slow or chronic form of hog cholera indicates an infection weak

in virulency.

Symptoms.

A post-mortem and anti-mortem study of hog cholera will show a greater variety of symptoms than any other disease affecting hogs. For this reason, it is often hard for the farmer who has not had special training along this line to detect the first sick hog in his herd, and often a large per cent of his hogs are sick before he even suspects they are sick. Then not being able to detect the nature of the disease he does nothing until most of his hogs are sick and the first ones to show any signs of being sick are beginning to die, when it is too late to do anything. So far, we know nothing that will cure an advanced case of hog cholera. Then, again, we see in some herds one or two hogs that contract a mild form of the disease and are off feed for a few days, but soon recover. From these animals the entire herd may become infected, and this before cholera is even suspected.

In the chronic form we are more apt to be deceived, and this is especially so when there has been a previous outbreak of an acute form on the farm. This is so because in the chronic form the affected hogs will linger along for weeks and sometimes for more than a month before they finally die, or recover, as the case may be. But the acute form usually wipes the entire herd out within a short time after it first gains

entrance in the herd.

Among the first symptoms seen in hogs affected with cholera is a loss of appetite, a tendency to hide in the litter or some secluded place and if forced to get up they show a stiffness in their gait, as if they had tender feet, and the back is usually more or less arched. At first there

is a tendency towards constipation which is followed in a few days by a very fetid diarrhea. In light skin hogs, and at times in dark skin hogs, a red or purple discoloration of the skin can be detected along the belly between the fore legs and at the base of the ears. This symptom is not always present but is frequently seen. When cholera is suspected, it is well to secure a clinical thermometer and take the temperature of a number of those hogs that are eating and apparently well.

We frequently find in a herd where there has been one or more sick hogs for several days a number of the hogs apparently well showing a temperature as high as 104 to 107 degrees Fahrenheit, and even higher. Hogs affected with cholera will often carry these high temperatures from three to five days and appear to be entirely healthy, but are ready to come down with an acute form of cholera. The normal temperature of

a hog is from 101 to 102 degrees Fahrenheit.

Owing to the high temperature, lack of appetite and general depression, vomiting, thumps, quick or jerky breathing is frequent. The muco-purulent secretion from the eyes often becomes so heavy that the

eyelids are adhered together causing the hog to become blind.

The most striking difference between the acute and chronic form of cholera is the duration of the disease. In the chronic form the temperature is not so high. The hog may continue to eat a little every day but becomes unthrifty and emaciated and may linger along in this condition for three or four weeks before dying. The acute form usually terminates in death between the eighth and fourteenth day.

When there is any doubt of the sick hogs being affected with cholera, a post-mortem examination should be made on one of the sick hogs in

order to make an accurate diagnosis.

Post-Mortem Appearances.

Skin.—A close examination of the skin will show red or purple spots along the belly, between the fore and hind legs and at the base of the ears; this is especially so in light skin hogs. In chronic cases the skin may become dry and hard and slough out in places. The ears and tail may also slough off.

Stomach.—The mucous membrane or inner lining of the stomach may be very much inflamed and red, frequently showing evidence of ulcers.

Lymphatic Glands.—Enlarged, congested, showing hemorrhagic spots when cut open. Of these glands receiving special attention in hog cholera are the mesenteric glands, or those along the intestines; lumbar and retroperitoneal are those lying near the back wall of the abdominal cavity; the lymphatic glands found near the angle of the jaw; the mediastinal and bronchial glands in the region of the heart and lungs, and the inguinal glands found beneath the skin high upon the inside of the thigh.

Intestines.—The inner lining, or the mucous membrane of the intestines, especially near the ilco-cecal valve, the place where the small intestine opens into the large intestine, may be congested and covered with small red spots. At this point in the intestine it is not uncommon to see ulcers varying in size and shape. One of the most constant is the somewhat circular button-shaped ulcer standing out from the surround-

ing mucous membrane, with a greenish-yellow center. The outer surface of the large and small intestines may be literally covered with bloody spots. Small greenish-yellow ulcers may be seen on the outer surface of both small and large intestines.

Spleen.—Almost without exception, the spleen or "milt" is enlarged, dark and soft and covered with small red spots and easily ruptured.

Kidneys.—When the capsule, or covering of the kidney is removed, dark red spots are seen. Frequently these hemorrhagic spots are so numerous that it reminds one of the speckling of a turkey's egg. Congestion and hemorrhagic spots are also detected when the kidney is cut open.

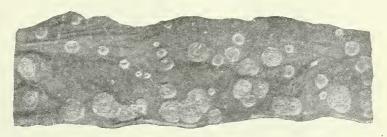

FIGURE 2.—Ulcers (large intestine), chronic form.

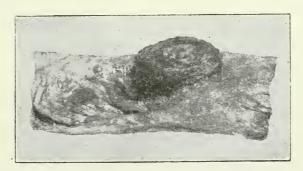

FIGURE 3 .- "Button ulcers" (large intestine), chronic form.

Bladder.—The inner lining of the bladder may be found congested with numerous hemorrhagic spots on the surface.

Heart.—Numerous petechiæ and hemmorrhagic spots may be found on the heart.

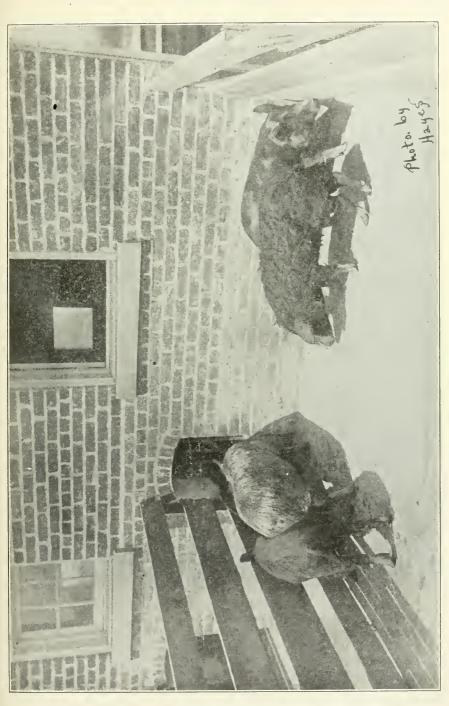

Lungs.—In well defined cases of cholera small red or hemorrhagic spots may be found on the lungs. Again large, dark, consolidated spots are found, due to congestion and collapse of the lung tissue. In the chronic form pus may be found in the lungs. Sometimes the lungs are adherred to the chest walls and diaphragm.

SYMPTOMS USUALLY FOUND IN WELL DEFINED CASES OF HOG CHOLERA.

Anti-Mortem.—Lack of appetite, unthrifty, high temperature, emaciation, arched back, wobbling gait, red or purple skin along the belly be-

FIGURE 4.—Kidney, showing typical lesions of hog cholera (hemorrhagic spots).

tween front and hind legs and base of ears, and constipation followed

by diarrhea.

Post-Mortem.—Hemmorrhagic spots on kidney, lung, intestinal lesions and congestion of lymphatic glands. Congested spleen studded with petechiæ spots.

Infected Premises.

The length of time before it is safe to put non-immune hogs on infected premises will depend largely upon the character of the grounds infected. If the grounds are well drained and are not covered with too much litter, so that the rays of the sun will reach all parts of the ground, it would probably be safe to add susceptible hogs to the premises in three months. But, if the grounds are not well drained and have low, wet or marshy places, it would not be safe to add susceptible hogs to the grounds under twelve months, or even longer. When conditions will permit every effort possible should be made to thoroughly disinfect the infected premises before hogs that are susceptible to cholera are added to the premises.

Sanitation.

Under the ordinary farm conditions, it is practically impossible to disinfect thorough enough to kill out all of the hog cholera infection, but where possible all litter should be raked up and burned. This can be done in small lots and should be followed with a spray of a five per cent solution of carbolic acid, lysol, creolin or any other reliable disinfectant, and a liberal application of lime. The pens and houses can be disinfected in a like manner; if they are inexpensive ones it would be better to tear them down and burn them. All mud holes and cesspools should be drained and filled up.

If these measures are followed one would most likely be safe in adding susceptible hogs to the premises. If the hog lots or pastures can be used for any other purpose and new quarters can be found for the hogs,

it would be much safer.

Susceptible hogs should be treated with anti-hog cholera serum if they are to be placed on the infected grounds under twelve months. Since it is practically impossible to thoroughly disinfect a large premise, the hogs should be immuned to cholera before they are allowed access to the infected grounds, but bear in mind it is always well to use disinfectants liberally around hog houses.

When cholera has broken out in a herd of hogs in a field, this field should be covered with a heavy application of lime, and a crop grown on it for one year before it is used again, unless the hogs are "immune."

Some of the Ways by Which Hog Cholera is Spread.

It is well to bear in mind that every case of hog cholera comes from a previous case of cholera. It is impossible to produce a case of cholera without having the germs that cause hog cholera. No matter how filthy the lots or pens in which the hogs are kept, they cannot have cholera unless the germs from a previous case of cholera are introduced. The disease cannot arise spontaneously. All secretions and excretions are laden with the infection and if allowed to enter into a susceptible hog's system will produce cholera.

(From group in State Museum—mounted by T. W. Adickes.)
FIGURE 6.—Buzzards feeding on cholera carcass.

Since hog cholera must come from some previous case of cholera, it behooves us to see that the carcasses of all hogs dying from cholera are properly disposed of. The infected lots and pens should be held under strict quarantine. All cholera carcasses should be burned or buried deep and covered with lime. Cholera may be carried from an infected premise by dogs, cats, rabbits, crows, pigeons, buzzards or any other animal that moves from one place to another.

THE TURKEY BUZZARD.

The turkey buzzard is one of the three worst agents by which hog cholera is disseminated in this State. The other two are free range, and running streams and overflows. Whenever the carcass of an animal is left on top of the ground, no matter what was the cause of death, the buzzards are certain to be attracted to the carcass. If the carcass is one of a cholera hog they feed upon it and fly away to some other farm, at times many miles away and they are certain to carry the hog cholera germs with them. If these germs are deposited in reach of other hogs they are certain to cause an outbreak of cholera. The importance of burying all carcasses, especially all cholera carcasses and carcasses of other infectious diseases, cannot be emphasized too much.

There is a general impression among all farmers that the buzzards are protected by law. This seems to be an erroneous idea. After a considerable search of the statute, we have been unable to find any law that would protect the buzzard. Since there is no question but what the buzzard disseminates disease germs, especially hog cholera germs, every farmer would be justifiable in killing all the buzzards he possibly can.

RUNNING STREAMS AND OVERFLOWS.

The infection can be carried for miles down a running stream. If infected hogs are allowed access to the stream of water running through the farm, the stream then becomes a source of disseminating the infection over a wide area. So it is not safe to allow hogs to have access to running streams that do not have their origin on the farm.

The overflows in the Eastern part of this State are a source of disseminating the infection over a wide area. Especially is this so where the dead hogs are not properly disposed of, or where the hogs die in the

swamps and no attempt is made to locate and bury them.

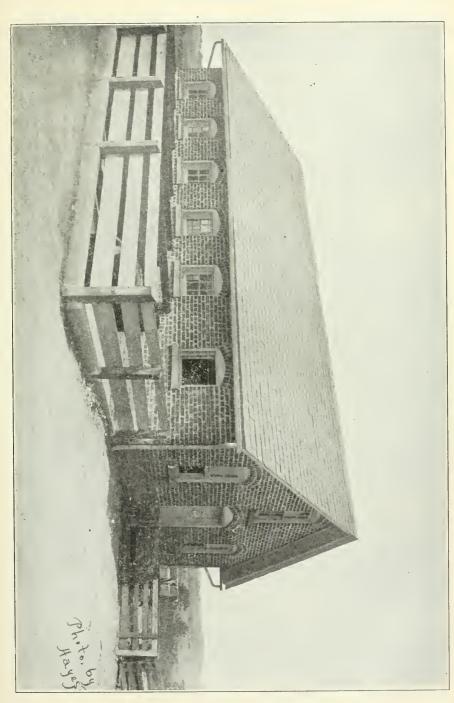

Often hogs in the free-range territory die from cholera in a running stream or in large swamps and are never seen by their owners. These hogs serve as centers from which infection is scattered broadcast during overflows.

Public Roads.

The public roads are another source of disseminating the infection. Sick hogs often have access to the public roads and leave them infected. It then becomes dangerous to drive well hogs on the public highway.

Show Hogs.

Often hogs contract cholera at shows and when brought back to the farm, and turned in the lots with the other hogs, become the agent by

which the entire herd is infected. All hogs coming from the shows or new hogs being added to the herd should be held under quarantine at least three weeks before they are allowed to run with the other hogs.

PUBLIC STOCK YARDS.

All public stock yards are infected with hog cholera germs. It is unsafe to purchase hogs from stock yards for breeding or feeding purposes. Nor should hogs intended for breeding or feeding purposes be unloaded in pens to be fed unless these pens are thoroughly disinfected. The cars in which the hogs are shipped should be thoroughly disinfected before the hogs are loaded. All hogs unloaded in public stock yards, not intended for immediate slaughter, should be treated with anti-hog cholera serum.

INFECTED HOGS RUNNING AT LARGE.

In the territory where live stock run at large, we find a larger per cent of hog cholera. This is due to hogs affected with cholera coming in contact with hogs from adjoining farms. In this way the infection in often spread from farm to farm.

Visitors.—Hog cholera infection can be carried on the shoes and clothes of people. It is unsafe for any one to visit an infected herd and

return to their own or any other herd of hogs.

Garbage.—Uncooked garbage from hotels, restaurants or other sources is dangerous. We know of no instance in this State where uncooked garbage has been fed for any length of time where cholera did not develop. Feed it only to immuned hogs or have it thoroughly cooked.

THE ANNUAL LOSS IN THE UNITED STATES FROM HOG CHOLERA.

The annual loss of hogs in the United States from hog cholera is estimated at the enormous sum of sixty million (\$60,000,000) dollars. If this enormous loss of a preventable disease was checked it would go a long ways in reducing the high cost of pork.

THE ANNUAL LOSS IN NORTH CAROLINA.

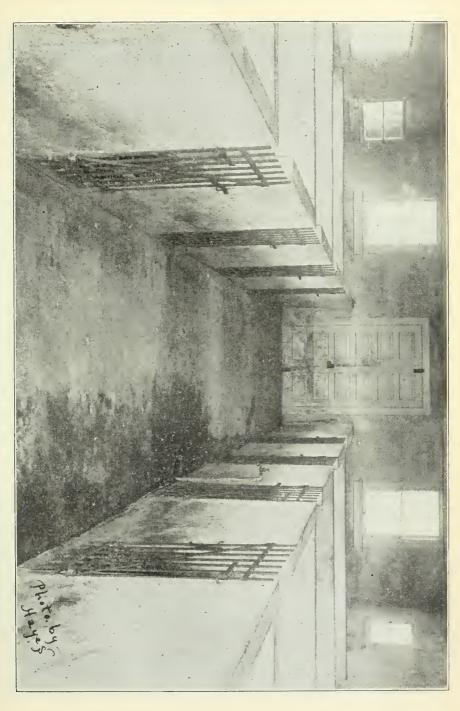

According to the best information we have the annual loss from hog cholera in North Carolina, both direct and indirect, is considerably over three quarters of a million dollars (\$750,000). This enormous loss is going on while many thousands of dollars are being sent out of the State annually for pork, lard and other meat products.

Susceptibility.

Young pigs and young shoats are more susceptible than older hogs, but often we find the older hogs the first to succumb to the disease.

As to the susceptibility of the different breeds, we do not believe there is any difference. The "scrub" hog and "mule-footed hog" succumb to the disease as readily as the pure breeds.

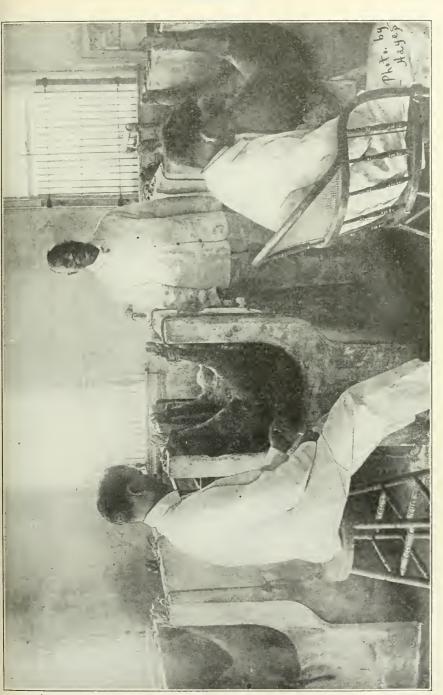

FIGURE 10.—Hyperimmunes being bled by tail.

MORTALITY.

The mortality will vary in different localities and on different farms. When cholera first makes its appearance in a locality the per cent of deaths, as a rule, is higher than it is at the end of the outbreak. The same is also true in communities where cholera has appeared for a number of years in succession. The per cent of losses will range around fifty per cent in some localities; in other as high as ninety-five per cent. This depends on the virulency of infection and the susceptibility of the hogs.

As a rule hogs recovering from cholera are greatly depreciated in value. Unless the hogs are exceptionally valuable ones, it would be more economical to destroy and burn them when they have developed a well defined case of cholera.

ANTI-HOG CHOLERA SERUM.

In order to-make potent anti-hog cholera serum, it is necessary to select a hog that is "immune" to cholera. This hog is one that has been treated with serum and virus at least twenty-one days, or one that has recovered from an attack of cholera. One attack of cholera confers life immunity. Into this "immune" hog ten cubic centimeters of virus are injected direct or indirect into the circulation for every pound of live weight. This hog is then known as a hyper-immune.

In the course of eight to ten days the hyper-immune is bled by the tail, taking as much blood as the hog will stand. As soon as the hog recovers from the effect of having a large quantity of blood removed from it, which is about a week, the hog is then bled again and this is continued until four bleedings have been made. Then the hog is re-hyperimmunized and bled four more times. This is continued until the tail becomes short, when the final bleeding is made by cutting the throat, and all of the blood is removed.

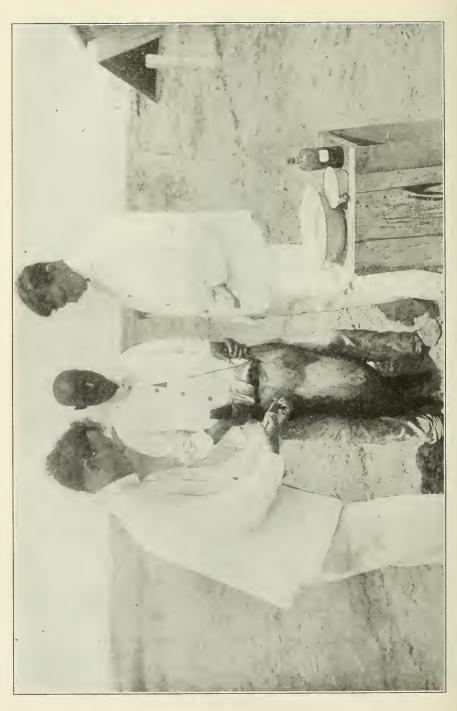

The blood from the tail and throat of the hyper-immunized hog is defibernated (the clot is removed) leaving the liquid portion of the blood, which is the serum. To this serum is added enough carbolic acid to make one-half of a one per cent solution. The acid is added as a preservative. This serum is a preventive to hog cholera and cannot produce hog cholera because it contains the anti-bodies which are antagonistic to the germs of hog cholera.

VIRUS.

The virus used to hyper-immunize the immune hog is secured by injecting a small amount of virus (the liquid portion of the blood) from an acute case of hog cholera into a susceptible hog, or by exposing a susceptible hog to hog cholera infection. When the hog has developed an acute case of cholera, the hog is bled by the throat and the blood is then defibernated. The virus or liquid portion of the blood is injected direct or indirect into the circulation of the immune hog.

FIGURE 11.—Bleeding by throat for virus.

·Anti-Hog Cholera Serum.

(The only known preventive for hog cholera.)

There are thousands of dollars spent annually for so-called sure hog cholera "cures." Agricultural papers are full of very attractive advertisements of fake remedies. To spend money for such "fakes" is nothing less than throwing it away.

It would be well to bear in mind that all products advertised as "cures" for hog cholera are worthless; also that a large per cent of the serum and

vaccines will not prevent hog cholera.

Anti-hog cholera serum, if properly prepared and administered will, without a doubt, prevent hog cholera but very little is claimed for it as a curative agent.

Ways of Vaccinating.

There are two ways by which hogs may be vaccinated with anti-hog cholera serum, the Serum Alone Method and the Serum Simultaneous Method. The Serum Alone Method consists of injecting the required amount of serum into the tissues of the hogs with a hypodermic syringe. The Serum Simultaneous Method consists of injecting the serum as in the Serum Alone Method, but at the same time a small amount of virus is injected.

The Serum Alone Method only confers immunity for a very short period, varying from four to eight weeks, whereas the Serum Simultaneous Method confers immunity, varying from a few months in very

young pigs to life immunity in older hogs.

As there is considerable danger attached to the Serum Simultaneous Method, it is not safe to put this method of treatment into the hands of persons who have not had special training for this purpose. This is so because a small per cent of the hogs treated by this method develop hog cholera and die. This is so when the method is applied by men who have had long training and wide experience in using the serum and virus. We think it would be a great mistake to distribute the virus with the serum over the State to any one applying for it. If this was done we would expect to see the entire State sooner or later "fired" with hog cholera. There is no danger of producing hog cholera by using the Serum Alone Method, and for this reason we think it is the only method to place in the hands of the untrained.

The serum is sent direct to any one ordering it, with full directions for using. If the directions are followed closely good results will follow. It is always better, whenever possible, to have some one inject the serum who has at least seen it injected, if they have not done so themselves. Our advice would be to employ a graduate veterinarian when possible

and have him inject the serum for you.

How and When to Use Serum.

The Serum Alone Method only gives temporary immunity lasting from four to eight weeks, an average of about six weeks. It is rather expensive to keep a herd of hogs immuned by his method. We believe it would be cheaper where a permanent herd is to be kept for breeding purposes

to use the Simultaneous or Double treatment. This would insure protection at all times to the foundation of the herd.

The owner of a herd of hogs should not delay any longer than possible in securing the serum and injecting his hogs when it becomes known that they have been exposed to cholera, or when it is known that cholera is in his community, if there is any possibility of the infection gaining entrance to his herd through any of the many channels of entrance.

When the serum is used shortly before or very soon after the hogs are exposed to cholera infection the per cent protected is often as high as a hundred, but usually ranges around 95 per cent. After cholera has gained entrance in a herd and a portion of the hogs are showing physical or thermal symptoms of cholera, the per cent saved of the remaining apparently well hogs will not be so high, but a good per cent of those showing no physical or thermal symptoms will be protected.

When a large number of hogs in a herd become sick and begin to die it is pretty safe to say that they are affected with hog cholera. Immediate steps should be taken to secure the serum and inject the remaining well hogs.

To inject the serum one must have a hypodermic syringe (preferably a 20 or 30 c.c. glass barreled one). This syringe should be sterilized by being boiled in water for fifteen or twenty minutes. Before using, the mouth of the serum bottle should be wiped off with a five per cent solution of carbolic acid and the serum then poured into the receptacle with a cover. Both the receptacle and cover should have been boiled in water for fifteen or twenty minutes and allowed to cool before pouring the serum into it. Keep the cover on all the time except when the serum is being poured into or taken from the receptacle. The hands of the person injecting the serum should be washed before beginning and kept clean all the time. Do not allow the syringe or needle to come in contact with soiled objects.

The serum is injected into the tissues either on the inside of the thigh or into the loose tissues between the foreleg and body. The needle is inserted perpendicularly to the depth of one-half or one inch, depending upon the size of the hog. The serum is then injected and the needle withdrawn. Before the needle is inserted the skin at the point selected should be washed with soap and water and then scrubbed with a reliable disinfectant, such as a five per cent solution of carbolic acid, lysol or creolin.

Hogs in infected herds showing a temperature above 104 degrees F. are considered to be affected with cholera. The hogs showing high temperatures should be given a double dose of serum; apparently well hogs in infected herds should be given more serum than hogs in non-infected herds. (See dose table.)

THE SERUM AS A CURE FOR HOG CHOLERA.

No claim is made that the serum will "cure" a well developed case of hog cholera. A small per cent of the hogs showing a temperature above 104 degrees Fahrenheit will, if given a large dose of serum, make

a recovery. We believe the per cent of recoveries will justify the expense of the serum used.

VACCINATING INFECTED HERDS.

Do not fail to take the temperature of all hogs in infected herds. Those showing a temperature of 104 degrees or higher should be given a double dose of serum.

Never use the Simultaneous treatment in infected herds (they already have enough infection). Hogs injected with a protective dose of serum and left in infected lots or pens for three weeks will, in all probability, contract enough infection to produce the same immunity as those treated with the Simultaneous method. However, one can never be sure of this.

THE DOSE OF SERUM.

Care should be used in estimating the weight of every hog injected because the amount of serum to be used will depend on the weight of the hog and not on the age. Always be certain not to underestimate the weight; it is much better to overestimate than to underestimate. If the weight is underestimated and too small a dose of serum is given, the hog will not be protected from cholera. There is no danger in giving an overdose of serum; the larger the dose the more certain the protection.

Avoid turning the hogs into muddy, filthy or dusty lots after they are injected. It is better to keep them in a lot for several days until the puncture wound caused by the needle has had time to heal. If the wound becomes infected abscesses may follow. When abscesses form they should be opened and washed with an antiseptic solution.

A complete and accurate record should be kept by every farmer using the serum. He should record the number of hogs that have died from hog cholera at the time the serum is injected; also keep a record of the number of sick hogs in the infected lots; how many treated with serum; and the number of both treated and not treated that die. Don't fail to take the temperature of all hogs in an infected herd. Those that show a temperature of 104 degrees Fahrenheit are considered affected with hog cholera.

THE SERUM PLANT.

The North Carolina Department of Agriculture has erected and equipped a modern anti-hog cholera serum plant. It is the Department's purpose to make and distribute a potent serum to the farmers of the State at cost of production.

In 1911 the charge for the serum was two and one-half cents per cubic centimeter. This has been gradually reduced until it is now being distributed for one and one-quarter cents per cubic centimeter, the cost of production.

TESTED SERUM.

All serum should be tested for potency before it is used in the field. Serum sent out by this Department is tested in the following manner. The bleedings from the tail and the final bleeding by the throat of a number of hyperimmune hogs are thoroughly mixed, which is then

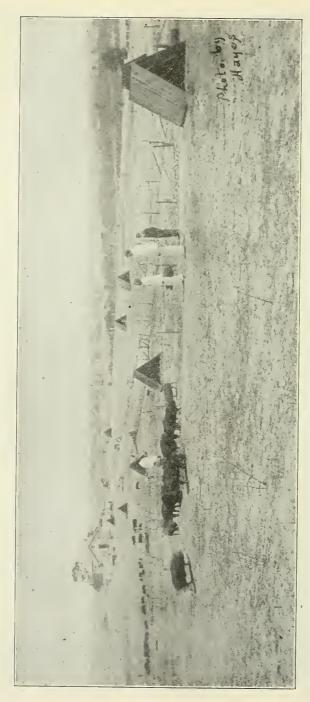

FIGURE 15.—South side of serum plant.

tested on susceptible pigs. The test is made by injecting two cubic centimeters of virus into each of four susceptible pigs (25 to 35 pounds) preferably from the same litter. These pigs are then injected with different amounts of serum. No. 1 would get two cubic centimeters of virus and twenty cubic centimeters of serum; No. 2, fifteen cubic centimeters of serum and two cubic centimeters of virus. No. 3, ten cubic centimeters of serum and two cubic centimeters of virus; No. 4 would get two cubic centimeters of virus and no serum. If No. 4 dies within fifteen days and Nos. 1, 2, and 3 show no signs of sickness, we then know that the virus used was virulent and that the serum protected Nos. 1, 2, and 3 from what would have been a fatal dose of virus.

DIRECTIONS FOR ORDERING SERUM.

The serum will be shipped, by express, C.O.D., to any one ordering it, unless check or money order accompanies the order. Do not fail to give correct address.

Always state correctly the amount of serum wanted, or give the weight of each hog to be treated. If a hypodermic syringe is desired, state so in your order, otherwise it will not be sent. A twenty cubic centimeter glass barreled syringe will be sent at cost, \$1.75, if ordered.

The serum will be shipped in the following size bottles:

30 c.c., 50 c.c., 100 c.c., 120 c.c., 150 c.c., 180 c.c., 200 c.c., 250 c.c.,

500 e.c., 750 e.c., and 1000 e.c.,

The cost of the serum is one and one-quarter cents per cubic centimeter. No serum will be taken back; when the serum is placed in the express office it becomes your serum.

Address all communications for serum to the State Veterinarian, Department of Agriculture, Raleigh, N. C.

VACCINATION DOSES.

It requires more serum per pound of weight to "immunize" young pigs than is required to "immunize" older hogs.

	Cholera-free Herds.	Infected Herds.
Suckling pigs	5 to 10 c.c.	10 to 15 c.c.

Penalty for Allowing Diseased Hogs to Run at Large.

"If any person having swine affected with the disease known as hog cholera, or any other infectious or contagious disease, and discovering the same, or to whom notice of the fact shall be given, shall fail of neg-

lect for five days to secure the diseased swine from the approach or contact with other hogs not so affected, by penning or otherwise securing and effectually isolating them, so that they shall not have access to any ditch, canal, branch, creek, river, or other watercourse which passes beyond the premises of the owners of such swine, he shall be guilty of a misdemeanor, and upon conviction shall be fined not exceeding fifty dollars or imprisoned not exceeding thirty days."—Section 3297 of the Revisal of 1905 of North Carolina; 1889, ch. 173, sec. 1; 1891, ch. 67, secs. 1, 3; 1903, ch. 106; 1899, ch. 47.

Penalty for Failure to Properly Dispose of Carcasses of Animals Dying from Infectious Diseases.

"If any hog or other animal shall die with the hog cholera or other infectious disease, and the owner thereof shall fail to burn or to so bury the same as to secure it from the reach or contact with other hogs or other domestic animals of value, or if he shall throw or place such hog or other animal in any ditch, canal, branch, creek, river, or other watercourses passing beyond his own premises, he shall be guilty of a misdemeanor and upon conviction shall be fined not more than fifty dollars or imprisoned not more than thirty days."—Section 3298 of the Revisal of 1905 of North Carolina; 1889, ch. 173, sec. 2; 1891, ch. 67, secs 2, 3; 1903, ch. 106; 1899, ch. 47.

LETTER OF TRANSMITTAL.

Hon. W. A. Graham,

Commissioner of Agriculture,

Raleigh, N. C.

Sir:—I submit herewith manuscript for a bulletin on Corn Silage and Cotton-seed Hulls for Fattening Beef Cattle. This important experiment was made on the Iredell Test Farm during the winter of 1913-1914, and should be considered a report of the progress of the work, as plans are made for continuing these and similar experiments on the Iredell Test Farm until the prominent questions relating to the fattening of beef cattle during the winter months have been thoroughly and carefully studied.

I recommend the publication of this report as the August Bulletin. Very respectfully,

DAN T. GRAY,
Chief in Animal Industry.

Approved for printing:

W. A. Graham, Commissioner of Agriculture.

SUMMARY STATEMENTS.

The lot of cattle fed cotton-seed meal and corn silage made only slightly larger gains than those fed cotton-seed meal and cotton-seed hulls. Lot 1 made an average daily gain of 1.62 pounds and Lot 2 1.63 pounds during the experimental period of 112 days.

The steers in Lot 1 were fed an average of 21.95 pounds of cotton-seed hulls per steer daily during the experimental period. The steers in Lot 2 were fed an average of 42.46 pounds of corn silage per steer daily during the experimental period. According to the gains made, this showed a relative feeding value of approximately one pound of cotton-seed hulls to two pounds of corn silage.

It required 1,352.2 pounds of cotton-seed hulls in conjunction with 458 pounds of cotton-seed meal to make 100 pounds gain, and 2,611.4 pounds of corn silage in conjunction with 458 pounds of cotton-seed meal to make 100 pounds gain. This shows that it takes, on the average, about two pounds of corn silage to replace one pound of cotton-seed hulls under the conditions of this experiment.

It cost \$11.43 to make 100 pounds gain in the lot fed cotton-seed meal and cotton-seed hulls, and \$10.92 in the lot fed cotton-seed meal and corn silage, the difference being 51 cents per hundred pounds in favor of the corn-silage-fed cattle.

When the steers were finished, those fed cotton-seed hulls for roughage were valued at \$7.50 per cwt. and those fed corn silage \$7.70 per cwt. This decision was corroborated by the slaughter data obtained at the abattoir. The silage-fed cattle were thicker and more uniformly covered with fat.

The comparative profit per steer in Lot 1 fed cotton-seed hulls for roughage, eliminating freight, cost of labor, and bedding, was \$8.29 per steer. The comparative profit per steer in Lot 2 fed corn silage for roughage was \$11.36 per steer, showing a difference of \$3.07 in favor of the corn-silage-fed cattle.

The shipping data obtained on these cattle showed that the steers fed corn silage did not shrink any more than steers fed cotton-seed hulls under like conditions otherwise. The average net shrink per steer from Statesville, N. C., to Richmond, Va., was slightly less than 45 pounds.

CORN SILAGE AND COTTON-SEED HULLS FOR FATTENING BEEF CATTLE

WORK CONDUCTED AT

IREDELL TEST FARM, STATESVILLE, N. C.

R. S. CURTIS, L. W. SHOOK, F. T. MEACHAM.

INTRODUCTION.

A great deal of interest has developed recently in the winter feeding of beef cattle. This is due to two conditions: first, because of the desire to incorporate the fertilizing value of cotton-seed meal in the form of manure, and, second, to utilize cheap or unsalable feeds in the roughage part of the ration and in the bedding to add humus to the soil. There is thus a twofold reason for feeding cattle, either of which is of much greater importance than ordinarily considered. Experimental workers and farmers who have had experience will admit that under present conditions there is, many times, no profit in the winter cattle-feeding industry, excluding the value of the manure. The manurial benefit to the land, however, is considered to be of unquestionable value.

This brings up the problem of the most feasible plan to follow in preparing fattening cattle for the market. The southern farmer usually has a number of roughage feeds available, and with comparatively little effort others of value can be provided. Cotton-seed hulls is the standard roughage feed throughout the South, and while acceptable in many respects as a roughage feed, it must be purchased direct from the cotton-seed oil mills. It is generally admitted that the farmer should not purchase roughage feeds, although cotton-seed hulls can sometimes be used to advantage either as a whole or a part of the roughage ration.

One of the principal drawbacks to the use of cotton-seed hulls is the fact that they cannot be used in conjunction with cotton-seed meal for a sufficient length of time to put cattle in prime market condition. For this reason it is an important problem to determine whether a substitute can be profitably used, either as a whole or a part of the roughage ration. The following results were obtained from an experiment designed to determine the feasibility of the plan suggested.

LOCATION OF WORK.

The results of the work herein reported were obtained from two carloads of forty-eight grade Shorthorn steers fed on the Iredell Test Farm at Statesville, N. C. The results were obtained under the best of experimental conditions. The feeding was done by a competent man during the entire feeding period of four and one-half months.

Work of this character in Iredell County is of unusual importance, owing to the natural conditions for cattle feeding and the great interest which was manifested in this experiment. At the close of the experiment a meeting was held to explain the results which had been obtained. Although an inclement day, a very acceptable number of farmers was present to learn the results and see the finished cattle.

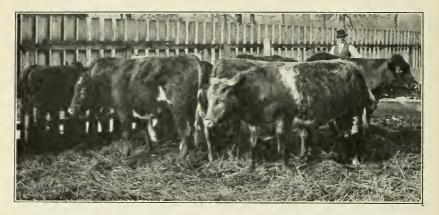

Fig. 2. A Group of the Steers Fed Cotton-seed Meal and Cotton-seed Hulls.

The conditions in this and surrounding counties for winter cattle feeding are especially favorable because of the proximity to oil mills and the fact that an unusual amount of roughage feed is produced which is available both for feeding and bedding purposes. While the local markets for cattle are not the most desirable, easy access can be had to the best eastern markets.

OBJECTS OF EXPERIMENT.

The fundamental object of the experiment was to determine the comparative value of corn silage and cotton-seed hulls each in conjunction with a like amount of cotton-seed meal. This problem redivides itself into two sub-problems, the first being to determine the average daily and total gains made, the cost of same, and, second, the market value of the finished animals fed on the two rations in conjunction with cotton-seed meal.

The importance of this problem is not fully recognized by the farmer until his finished animals are offered for sale. The average farmer is usually not fully acquainted with market conditions. He is, therefore, unable to fully appreciate the value of a feed which will finish cattle in prime condition and enable him to command remunerative prices. Sufficient importance is not attached to the difference between producing gain on an animal and obtaining a wide margin, that is, the difference between the buying and selling price. Some feeds make acceptable gains, but do

not produce a desirable finish, upon which the amount of margin depends almost wholly. These factors thus briefly explained are the important objects of the work.

PLAN OF WORK.

The experiment was planned so that every condition would be the same in each lot of cattle except the variation in the roughage rations, which was the real nucleus of the experiment. The cattle were divided into six pens of eight steers each. Three pens of cattle were fed corn silage and three pens cotton-seed hulls, thus making a car-load in each lot. Two pens of the corn-silage-fed cattle and two pens of the cotton-seed-hulls-fed cattle were fed on the south side of the cattle barn. The third pen of corn-silage-fed and cotton-seed-hulls-fed cattle were fed on the north side of the barn. All shelter and exposure conditions were therefore exactly the same.

The cattle were divided into the two lots of twenty-four head each as equally in weight, quality, and condition as possible. The preliminary rations were the same for each lot. This period extended from October 15, 1913, to November 2, 1913, inclusive, the total preliminary period being 19 days. During this time the roughage ration remained the same for all the cattle, and the cotton-seed meal was increased uniformly toward the standard or experimental ration, which was 7.5 pounds per animal daily.

Table 1—KIND AND AVERAGE QUANTITY OF FEEDS GIVEN PER STEER DAILY DURING THE EXPERIMENTAL PERIOD.

Period.	Lot 1 (24 Steers).	Lot 2 (24 Steers).
November 3, 1913, to February 22, 1914—112 Days.	7.45 pounds cotton-seed meal 21.95 pounds cotton-seed hulls	7.45 pounds cotton-seed meal. 42.46 pounds corn silage.

The foregoing table brings out clearly the method of comparison. The daily cotton-seed meal ration is the same for each lot, the only variation being in the amount of roughage feeds fed as indicated.

At the beginning of the final or experimental period one lot-of cattle was put on cotton-seed hulls and the other lot on corn silage. This marked the date of comparative results herein given. The increase in cotton-seed meal was continued until November 15, when all the cattle were placed on the standard ration of 7.5 pounds per animal daily. The ration of each lot was increased to 8 pounds on January 26, 1914, just four weeks prior to the close of the experiment. With the exception of the last three days of the feeding period the rations were continued as outlined. On February 23 they were changed somewhat to prepare the steers for shipment. This consisted in a reduction of the cotton-seed meal and the introduction of cotton-seed hulls in the ration of the corn-silage-fed cattle.

The comparative results as given in this bulletin include the data from November 3, 1913, to February 22, 1914, inclusive, making the total experimental period 112 days. The data given in the financial statements

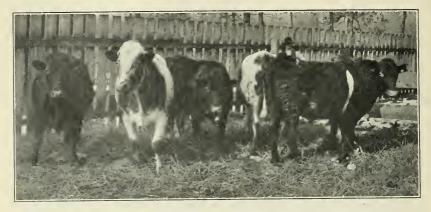

Fig. 3. A Group of the Steers Fed Cotton-seed Meal and Corn Silage.

includes all items of expenditure from the time the cattle were loaded for shipment to the feed lot until they were loaded and turned over to the commission buyer at the local shipping station.

LENGTH OF EXPERIMENT.

The length of the experiment has been treated elsewhere in considerable detail. The preliminary period was 19 days, the experimental period 112 days, and the period preparatory to shipment 3 days, making a total feeding period of 134 days. The most important point to bring out in this connection is the fact that the experimental period was not of sufficient length to bring out the characteristic difference in the value of the two roughage feeds used.

Former experiments* show that for about 100 days the results obtained from using cotton-seed hulls and corn silage in conjunction with cotton-seed meal are not greatly different. It is after the expiration of the one-hundred-day period or thereabouts that marked differences in the value of these feeds usually occur. Even under the conditions of this experiment, however, there was a marked difference in the results, but more especially in the value of the finished animals. The difference in the gains was not as great as would have been likely had the feeding been continued for a longer period. The results under the conditions of the experiment were not materially different than anticipated.

^{*}N. C. Exp. Sta. Bulletins, 218-222.

KIND OF STEERS USED.

The steers used in this work were purchased in the western or beef cattle producing section of this State. They were classed as 900-pound feeders. When taken from the pasture in the mountains they weighed slightly under 920 pounds per head. The steers were an average grade of 900-pound feeders usually secured in this State, there being a moderate variation in weight and quality. When the cattle were divided these qualities were apportioned equally in each of the two lots fed cotton-seed hulls and corn silage. The cattle were dehorned grade Shorthorns, and reasonably uniform in weight, quality, and condition at the beginning of the feeding experiment.

SHELTER AND WATER SUPPLY.

The cattle were fed in a closed barn with a lean-to shed on the south side, as shown in the illustration. Each of the stalls, including both the barn and shed portion, was twenty feet wide and twenty-six feet long. The feed troughs extended entirely across the end of the stalls adjacent to the alleyway, making two and one-half feet of feeding space for each

Fig. 4. Barn in Which Steers Were Fed.

steer. Both the steers and the manure were kept under cover the entire time except during the preliminary period in which the steers were left in the pasture during the daytime. The only exposure was the small amount of open space at each end of the shed and on the south side of same where water was provided.

The water was furnished from that collected from the barn roof and from a well, from which it was pumped by a gasoline engine. The cattle had water before them at all times. This is a very important matter both for the farmer and the experimental worker. Cattle fed cotton-

²⁻August

seed hulls should have special attention, owing to the dry, undigestible nature of this roughage feed. The writers desire to emphasize the necessity of a plentiful and regular water supply for steers, especially since the idea is prevalent that cattle need only a limited amount of water at certain times in the day. Better gains will always be secured when the steers have free access to water.

BEDDING MATERIAL.

The bedding material used consisted of leaves, wheat straw, and corn stover. A sufficient quantity was used to keep the cattle reasonably clean and conserve the liquid manure. Bedding is rather difficult to obtain in many instances for winter cattle feeding work. For this reason, and the fact that the manure can be so much better saved, it is advisable to feed entirely under cover, with the exceptions following. Work is under way in sandy sections of the State to determine the feasibility of feeding cattle on the land where the manure is to be applied. *A brief summary of this work has just been published. It is impossible to follow this practice in the clay sections, however, because of tramping and puddling the soil.

In this feeding experiment there was no waste roughage, so that the entire amount of bedding was supplied especially for the purpose. When corn stover is fed, a large quantity of the coarser material not eaten by the cattle can be utilized for bedding purposes. These cattle were bedded on the average about once each week. During bad weather material was supplied at shorter intervals. During the first part of the work leaves were used largely. During the last part wheat straw and corn stover were used.

VALUATION OF FEEDS.

A standard market value was placed on each of the feeds used. The valuations given include the cost of delivery to the farm barn. The cotton-seed meal was rated at \$27.75 per ton, the cotton-seed hulls at \$7.50 per ton, and the average valuation of corn silage was placed at \$3.50 per ton. The latter figure fixing the value of corn silage may be too high under some conditions in the State and too low in others. This valuation was fixed as an average for the whole State.

METHOD AND TIME OF WEIGHING CATTLE.

In the financial statements the mountain weights of the cattle are used for making the calculations on the initial cost. The final weight is the same as that used in the discussion of the experimental results.

In the beginning of the experimental period the cattle were weighed on three consecutive mornings before being fed and watered, and the average of these three weights taken for the initial experimental weight.

^{*}N. C. Exp. Sta. Circular-Letter.

The monthly weights and the final experimental weights were made always under normal conditions. The cattle were weighed each morning as nearly the same time as possible before any feed or water had been given.

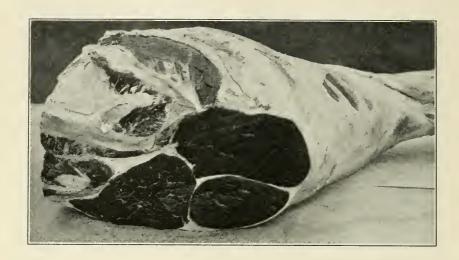

METHOD OF FEEDING.

When the cattle first arrived at the farm they were turned on a small pasture, where they remained in the daytime during the preliminary period. After this period of nineteen days they were placed in the barn with eight steers in each of six pens and fed two equal feeds regularly each morning and evening. The roughage was given in moderately large quantities and increased gradually until a full feed of corn silage and cotton-seed hulls were being fed. This consisted on the average during the experimental period of 21.95 pounds of cotton-seed hulls and 42.46 pounds of corn silage. This is about the proportion in which these two feeds are usually given in practical feeding work.

Table 2—AVERAGE DAILY AMOUNT OF COTTON-SEED MEAL, COTTON-SEED HULLS AND CORN SILAGE FED PER STEER DAILY BY 28-DAY PERIODS, INCLUDING THE PRELIMINARY AND EXPERIMENTAL PERIOD.

	Cotton-seed Meal.		Cotton-seed Hulls.		Corn Silage.	
Date Periods.	Lot 1.	Lot 2.	Lot 1.	Lot 2.	Lot 1.	Lot 2.
19 days	2.20	2,20	*11.67		†13.01	14.80
28 days	6.79	6.79	22.54			38.21
8 days	7.50	7.50	22.47			41.74
28 days	7.50	7.50	20.89			45.00
28 days	8.00	8.00	20.39			44.80

The cotton-seed meal was fed first at the rate of 1 pound per animal daily, and increased gradually until the standard ration of 7.5 pounds per steer daily was reached. In both cases the cotton-seed meal was fed, mixed with the cotton-seed hulls and corn silage. The roughage feeds were placed in the troughs first, after which the meal was spread over them and mixed evenly and thoroughly. Special attention is called here to the necessity of mixing the cotton-seed meal and roughage feeds thoroughly. This will prevent some steers from getting more than their share of the meal, which may thus cause cotton-seed meal sickness or an uneven finish. Thorough mixing is an inducement for steers to eat all of their roughage, besides furnishing in each case a very desirable dilutent for the cotton-seed meal. Successful feeding of cotton-seed meal depends on two factors: First, the meal must be fed in small quantities in the beginning and gradually increased; second, it must be thoroughly mixed with coarse feeds such as those used in these experiments.

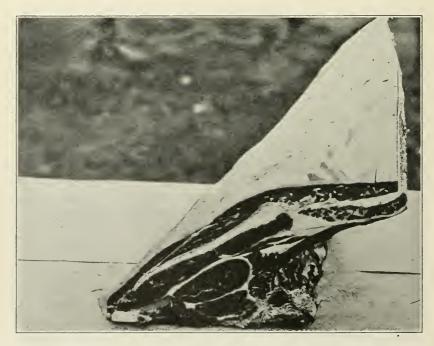

Fig. 5. The Condition of the Round and Rib of a Representative Steer Taken from Lot 1 at Beginning of Experiment.

Ration, Cotton-seed Meal and Cotton-seed Hulls.

Fig. 6. The Condition of the Round and Rib of a Representative Steer Taken from Lot 2 at Beginning of Experiment.

Ration, Cotton-seed Meal and Corn Silage.

DISCUSSION OF RESULTS.

In comparing the figures on the comparative profit per steer in each lot, it should be kept clearly in mind that only the cost of the steers, the cost of feed, and selling price are considered. The freight, labor, bed-

Fig. 7. The Condition of the Loin of a Representative Steer Taken from Lot 1 at Beginning of Experiment.

Ration, Cotton-seed Meal and Cotton-seed Hulls.

ding, and manure are all eliminated from this discussion. Since this is a determination of the comparative cost, valuation, and profit of the finished steers, these items are all eliminated to avoid confusion. This is customary in experimental work of this kind. Even though these items

Fig. 8. The Condition of the Loin of a Representative Steer Taken from Lot 2 at Beginning of Experiment, Ration, Cotton-seed Meal and Corn Silage.

were included, the comparative results would be the same. However, the total profit per steer would be reduced. The final results in either case lead to the same conclusions.

In the financial statements all items of expense are included from the time the cattle were loaded in the mountains until they were loaded for shipment to the final consuming market. The only difference in these two statements, that is, the experimental data and the financial statement, is that the first is comparative and the second absolute. The experimental statements show what would result if a certain practice was followed on the farm, while the financial statements show what actually occurred in this particular experiment from a practical standpoint.

All of the fundamental data obtained during the experimental period are summarized in the following table. The value of the cattle at the beginning of the experiment was the same, while at the close there was a difference of 20 cents per cwt. affixed by three parties in close touch with market conditions. The initial weight of the cattle was practically the same, while there was a variation of only three-tenths of a pound in the average total gain per steer.

Table 3—SUMMARY OF COMPARATIVE RESULTS OBTAINED FROM FEEDING BEEF CATTLE.

		913, to February sive—112 Days.

Fig. 9. The Interior of a Slaughtered Carcass from Lot 1 at the Close of the Experiment.

Ration, Cotton-seed Meal and Cotton-seed Hulls.

Fig. 10. The Exterior of a Slaughtered Carcass from Lot 1 at the Close of the Experiment. Ration, Cotton-seed Meal and Cotton-seed Hulls.

One important factor brought out was the relation between cotton-seed hulls and corn silage for steer feeding purposes. From the experiment it is shown that two pounds of corn silage will replace one pound of cotton-seed hulls. From these figures corn silage can be charged at \$4 per ton against steers when cotton-seed hulls sell at \$8 per ton, which was about the average price paid this year by most of the feeders in the State. Under these conditions the feeder would still have the advantage of getting the extra quality and finish obtained from the use of corn silage. A difference of 20 cents per cwt. would mean an approximate increased profit of \$50 per car on every load of steers fed. When cotton-seed hulls can be purchased for less than \$8 per ton these figures would be altered to the extent of the difference in the price of the hulls.

The cost per hundred pounds gain on the corn-silage-fed cattle was 51 cents less than on the cattle fed cotton-seed hulls. The difference in cost is not as great as ordinarily obtained in feeding steers under these conditions. The longer the feeding period in an experiment of this character usually the greater the difference in the average cost per hundred pounds gain. The profit per steer was \$3.07 more on the cattle fed corn silage than those fed cotton-seed hulls. The relative difference only should be considered in studying these latter figures, as freight, labor, and bedding are not charged against the cattle.

AVERAGE DAILY GAINS DURING EXPERIMENTAL PERIOD.

The following table shows the gains by months of the two lots of steers fed cotton-seed hulls and corn silage. The average of one of the three pens of corn-silage-fed cattle was very low the fourth month. This makes the average for the lot during the fourth month less than the average for the lot on cotton-seed hulls. This is an unusual condition. However, the fault was not with the entire lot of corn-silage-fed cattle. The two other pens in this lot made normal gains during the fourth month. The almost inappreciable gain of the one pen reduces the average to .17 pounds less than the average for the lot of cattle fed cotton-seed hulls. The average gain for the whole period of four months is slightly more for the corn-silage-fed steers.

Table 4—AVERAGE DAILY GAIN PER STEER BY MONTHS DURING THE EXPERI-MENTAL PERIOD.

November 3, 1913, to February 22, 1914, Inclusive—Period of 112 Days.	Average Daily Gain per Steer.		
	Lot 1.	Lot 2.	
First month	1.86	1.73	
Second month	1.72	1.96	
Third month	1.82	1.90	
Fourth month	1.09	.92	
Average	1.62	1.63	

Former experiments* show that if cattle are fed longer than four months under the conditions which existed in this experiment the cornsilage-fed cattle will continue to gain and increase in value for thirty to sixty days longer, while those fed cotton-seed hulls will decrease materially in gains at this stage, and consequently in market value. Market conditions, however, made it necessary to dispose of these cattle before the expiration of the full experimental period.

VALUATION OF CATTLE.

The entire number of cattle was sold for \$7.60 per cwt. at the farm, weighed up after twelve hours yarding from feed and water. The valuations placed on each lot of twenty-four cattle was \$7.50 per cwt. for the cotton-seed-hulls-fed cattle and \$7.70 per cwt. for the corn-silage-fed

Fig. 11. The Condition of the Rib Cut Taken from a Steer in Lot 1 at Close of Experiment.
Ration, Cotton-seed Meal and Cotton-seed Hulls.

cattle. This difference was clearly apparent to all parties who saw them. The difference in price was established by three parties in close touch with market conditions.

The corn-silage-fed cattle were in better condition at the time they were sold, having a thicker, smoother, and more uniform distribution of fat. All outward indications of condition showed the corn-silage-fed

^{*}N. C. Exp. Sta. Bulletins, 218-222.

cattle to be in much better market condition. The cotton-seed-hulls-fed cattle did not show the sleek, smooth condition of skin and hair characteristic of well-finished animals. The supposition that cattle fed corn silage shrink abnormally in transit was not borne out by the data obtained on these steers. While the cattle were not divided in the cars the same as they were fed in the pens, the average net shrink was only 45 pounds per head between Statesville, N. C., and Richmond, Va. Considering that they were on the road sixty hours, a lighter shrink would not have been anticipated even on cattle fed entirely on dry roughage feed.

COMPARATIVE FINISH OBTAINED.

At the time these cattle were placed on feed one representative steer was taken from each lot and slaughtered to determine the condition of the animals. This was for the purpose of getting photographs and also for making a study of the admixture of flesh and fat. The condition of these two animals in this respect is brought out in the table descriptions and photographs of the cuts herein shown.

INITIAL AND FINAL SLAUGHTER DATA.

The two representative steers used to determine the initial slaughtered condition of the two lots of cattle weighed 1,820 pounds after a drive of 17 miles to Asheville, N. C., where they were slaughtered. After arriving at Asheville, Steer 1 weighed 820 pounds and Steer 2 weighed 890 pounds, or a total of 1,710 pounds. This showed a total shrink of 110 pounds from the farm to the slaughter-pens.

Steer 1 was blocky and in average condition of flesh. The animal was reasonably representative of the steers in Lot 1 fed cotton-seed meal and cotton-seed hulls. Steer 2 was somewhat more rangy, with less condition than Steer 1. This favored condition, however, is always provided in an experiment where it is necessary to deal with comparisons. While an average of these dressing percentages was used, the steer representing the cotton-seed-hulls-fed cattle had the advantage in the beginning over

the one representing the corn-silage-fed cattle.

These two steers were slaughtered on November 8, the day following their arrival at the slaughter-house. This was five days later than the inauguration of the experimental work at the State Test Farm. The dressing percentages are based on the live weights taken the same morning the steers were slaughtered. Before slaughtering, the judges of these animals made a difference of one-fourth of a cent per pound in favor of Steer 1. After slaughtering, however, there was a greater difference than anticipated, owing to the greater amount of outside and internal fat on Steer 1. The meat of both steers had a bright red color and a good texture. However, Steer 1 was considered to be worth one-half cent per pound more live weight than Steer 2, owing largely to the amount and condition of the fat covering.

The finished cattle when judged alive in the feed lots just prior to shipment showed the corn-silage-fed steers to be fully 20 cents per hundred better than the cotton-seed-hulls-fed steers. This was borne out by the examination made at Jersey City, N. J., where one car-load of the cattle was slaughtered. The other load of steers was sold to local butchers in Richmond, Va., so that accurate slaughter data could not be obtained. The corn-silage-fed cattle were thicker and more uniformly covered than those fed cotton-seed hulls. The illustrations show a more uniform distribution of fat, both on the interior and exterior of the sides. The outside fat is thicker, and there is a better marbled condition.

	Lot 1—Cotton-seed-hulls-fed Cattle.		Lot 2—Corn-silage-fed Cattle.			
	Live Weight.	Dressed Weight.	Average Dressing Percentage.	Live Weight.	Dressed Weight.	Average Dressing Percentage.
Average dressing percentage of two steers at beginning of experiment	850 800	435 427	} 52.24	800 850	427 435	} 52.24
of steers in each lot at close of experiment	33,310	18,164	54.53	12,700	7,164	56.41

The average dressing percentage of the twelve cattle fed on cottonseed hulls was taken with nineteen other steers with which they were shipped from Richmond to Jersey City. These steers were of practically the same grade and quality as the twelve steers with which they were sold and weighed. The twelve steers fed on corn silage were weighed together alive, and when dressed, so that the average dressing percentage given is exact for this lot.

COMPARATIVE PRICES RETURNED FOR FEEDS USED.

It is interesting and instructive information to know the prices returned for certain feedstuffs when marketed through farm animals. The following table shows the prices obtained in this work when feeds are charged at varying prices. The figures written in italics indicate the market prices charged in this work and the prices returned for supplementary feeds under these conditions.

In other sections of the State where the prices of feeds vary somewhat these figures will enable the reader to approximate the results which could be obtained in cattle feeding. In all cases the feeds returned more than their estimated market value. Charging cotton-seed hulls at \$7.50 per ton, the cotton-seed meal returned \$30.34 for each ton fed. When

Fig. 12. The Interior of a Slaughtered Carcass from Lot 2 at Close of Experiment.

Ration, Cotton-seed Meal and Corn Silage.

Fig. 13. The Exterior of a Slaughtered Carcass from Lot 2 at Close of Experiment.
 Ration, Cotton-seed Meal and Corn Silage.

cotton-seed meal was charged at \$27.75 per ton, the cotton-seed hulls returned \$8.38 per ton. When corn silage was charged at \$3.50 per ton, the cotton-seed meal returned \$37.71 per ton. Likewise when the cotton-seed meal was charged at \$27.75 per ton, the corn silage returned \$5.25 per ton. All of these figures are exclusive of the manurial value of the feeds.

Table 6—COMPARATIVE PRICES RETURNED FOR EACH TON OF THE VARIOUS FEEDS USED WHEN MARKETED THROUGH STEERS.

		Market Price of Feed Per Ton.	Price Returned for Each Ton of Feed.
	Price returned for each ton of cotton-seed meal when fed with cotton-seed hulls at different market prices.	Cotton-seed hulls— \$ 6.00 7.50 9.00	Cotton-seed meal— \$ 34.76 \$0.34 29.92
Lot 1.	Price returned for each ton of cotton-seed hulls when fed with cotton-seed meal at different prices.	Cotton-seed meal— 25.00 27.75 30.00	Cotton-seed hulls— 9.31 8.38 7.61

APPLICATION OF RESULTS.

The results of an experiment of this nature are of great importance to the farmer who expects to cater to a discriminating market. Feeders who handle native cattle, or feed in less than car-load lots, cannot use corn silage as economically as the type of feeder formerly described. This is largely because local markets will not pay for extra quality and finish such as that obtained with corn silage.

Where good, thrifty, high-grade steers are fed, such as those for which a premium is paid on a central market, corn silage from the results of this and other experiments can be used with economy and profit.* This experiment, in conjunction with a number of others carried on by the writers, shows that corn silage is the best supplementary feed to use with cotton-seed meal. The reasons why are explained elsewhere in detail in this bulletin.

^{*}N. C. Exp. Sta. Bulletins, 218-222.

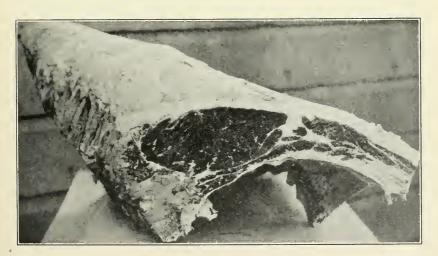

Fig. 14. The Condition of the Rib Cuts Taken from a Steer in Lot 2 at the Close of Experiment.

Ration, Cotton-seed Meal and Corn Silage.

All cattle feeders in the State have access to the best eastern markets, either through buyers or direct shipments. The results of this experiment show that cattle fed a straight cotton-seed meal and hulls ration will not command a premium like those fed cotton-seed meal and corn silage. Steers which are short-fed from ninety to one hundred and twenty days and marketed locally can be fed satisfactorily on a straight cotton-seed meal and hulls ration. The addition of corn silage even during this short period, however, would give more finish than otherwise. The economy of this practice would depend entirely on the relative market value of cotton-seed hulls and corn silage. If cotton-seed hulls are high in price and corn silage is available, it would likely be economy to use corn silage, at least for part of the roughage ration. If cotton-seed hulls are low in price, it would not be economy to use corn silage unless the cattle were to be long-fed and sold on a discriminating market. Otherwise a straight cotton-seed meal and hulls ration would be more practical. These are factors which depend entirely on the kind of cattle used, the length of the feeding period, the relative cost of the roughage feeds and the place where the cattle are marketed.

FINANCIAL STATEMENTS.

The financial statements given herein are furnished entirely for the benefit of the farmer or practical feeder. This data has no relation whatever to the comparative results recorded formerly in the bulletin. These statements following include all items of expense which would naturally be incurred by the practical cattle feeder. Special attention has been given to these statements to bring out in detail the difference between cotton-seed hulls and corn silage for feeding solely with cotton-seed meal. The market value of corn silage is figured at three prices to suit all conditions in the State.

The advisability of using corn silage exclusively with cotton-seed meal has not been fully established. The writers have in mind some extensive experiments to determine the feasibility of feeding cotton-seed hulls with the cotton-seed meal for ninety to one hundred days, after which corn silage will be substituted wholly or in part for the cotton-seed hulls. This is based on the fact that cotton-seed hulls and corn silage will give about the same results for the period above mentioned. After this, however, the corn silage begins to show a decided value. As far as the results herein reported are concerned, the value of corn silage as a sole roughage feed during the entire feeding period is clear.

LETTER OF TRANSMITTAL.

Raleigh, August 1, 1914.

Hon. W. A. Graham, Commissioner of Agriculture, Raleigh, N. C.

Sir:—I have the honor to submit herewith the report on the recleaning, analysis, and germination of the agricultural and vegetable seed samples collected and analyzed in accordance with the North Carolina Pure Seed Act; also, samples submitted by interested individuals, from July 15, 1913, to July 15, 1914, and recommend its publication as the September Bulletin of the Division of Agronomy and Botany of this Department.

Respectfully submitted,

Approved for printing: W. A. Graham, Commissioner of Agriculture. J. L. Burgess, Agronomist and Botanist.

REPORT OF THE DIVISION OF AGRONOMY AND BOTANY FOR 1914

By James L. Burgess, Agronomist and Botanist in Charge.

GENERAL REMARKS.

According to the provisions of the North Carolina Pure Seed Act, seed samples have been collected and analyzed since the act went into effect, July 1, 1909. The present publication is the fourth report of seed tests made by this Department, and includes all samples received from July 15, 1913, to July 15, 1914. During that time 1,773 samples in all have been tested; total agricultural seed samples 955, samples from inspectors 727, samples from individuals 228. Total samples for purity was 872, total samples for germination was 948. Germination tests were made of 818 samples of vegetable seeds. Also 123 samples of tobacco seed were received and cleaned for farmers of the State.

The volume of work in the Seed Laboratory in the handling of agricultural and vegetable seeds, has almost doubled within the past year,

as the following tables will show.

TABLE No. 1.

TOTAL NUMBER OF SAMPLES OF AGRICULTURAL SEEDS RECEIVED.

	1913	1914

SEED SHOULD BE TESTED AND THE VALUE KNOWN BEFORE PURCHASING.

The wisdom of having seed tested and of knowing the actual cost and value of the seed to be planted may be illustrated by the following data. These samples were tested in the laboratory, and are fairly typical of the different grades of seed offered on the market at the same price.

TABLE No. 3.

Laboratory Number	Kind of Seed	Retail Price	Actual Cost	Actual Value
1388	Crimson Clover	\$0.15 per pound	\$0.16 per pound	95 per cent.
2232	Crimson Clover	.15 per pound	1.30 per pound	11 per cent.
1427	Red Clover	.20 per pound	.21 per pound	96 per cent.
1409	(No Dodder.) Red Clover	.20 per pound	.30 per pound	48 per cent.
2108	(Dodder present.) Orchard Grass	.20 per pound	.22 per pound	73 per cent.
2024	Orchard Grass	.20 per pound	.56 per pound	25 per cent.
1534	Redtop	.20 per pound	.22 per pound	87 per cent.
2157	Redtop	.20 per pound	.32 per pound	37 per cent.

WEED SEEDS.

The three kinds of weed seeds of most frequent occurrence in the principal kinds of agricultural seeds tested are given below, the one found most frequently being listed first:

Alfalfa—Buckhorn, Green Foxtail, Lamb's Quarters.

Bluegrass, Kentucky—Field Sorrel, Buckhorn, Large Mouse-ear Chickweed.

Clover, Crimson—Black or Hop Medic, Wild Mustard, Slender Foxtail.

Clover Red—Buckhorn, Curled Dock, Green Foxtail.

Clover, White—Field Sorrel, Black or Hop Medic, Large Mouse-ear Chickweed.

Grass, Orchard-Field Sorrel, Buckhorn, Cheat.

Oats—Cheat, Corn Cockle, Darnel.

Redtop-Yarrow, Rugel's Plaintain, Woolly Panicum.

Out of 51 samples of Red Clover seed tested, Dodder was found to occur in 21 samples, and in no samples of Alfalfa out of 8 samples tested.

According to section 5 of the North Carolina Seed Act, the occurrence of the following weed seeds in agricultural seeds to be used for planting is considered unlawful: Wild Onion or Garlic (Allium rineale L. and A. Canadense L.), Wild Mustard (Brassica arvensis (L.) Ktz.), Couch-grass (Agropyron repens (L) Beauv.) Canada Thistle (Carduus arvensis (L.) Robs.), Wild Oat (Avena fatua L.), Clover Dodder (Cuscuta Epithymum Murr), Corn Cockle (Agrostemma Githago L.), Cheat (Bromus secalinus L.), Dog Fennel (Eupatorium capillifolium (Lam.) Small.), Wild Carrot (Daucus Carota L.).

TABLE No. 4.

Showing the Fifty Weed Seeds of Most Common Occurrence, Found in All of the Samples Tested for Purity.

(872 Samples Examined.)

	Scientific Name	Common Name	Found in
1	Rumex crispus	Curled Dock	178 samples

14	Chenopodium album	Lamb's Quarters	49 samples
15	Cerastium vulgatum	Larger Mouse-ear Chickweed	49 samples
16	Carex spp	Sedges	46 samples
17	Achillea Millefolium	Yarrow	44 samples
18	Sherardia arvensis	Blue Field-madder	42 samples
19	Vicia hirsuta	Hairy Tare	41 samples
20	Holcus lanatus	Velvet Grass	40 samples
21	Agrostemma Githago	Corn Cockle	39 samples
22 :	Juneus spp	Rushes	38 samples
23	Galium Aparine	Cleavers	37 samples
24	Lolium temulentum	Darnel	37 samples
25	Polygonum Convolvulus	Black Bindweed	32 samples
26	Ambrosia artemisiaefolia	Ragweed	31 samples
27	Bromus hordeaceus	Soft Chess	31 samples
28	Bromus racemosus	Upright Chess	29 samples
29	Festuca myuros	Rat's-tail Fescue Grass	29 samples
30	Lepidium apetalum	Apetalous Peppergrass	28 samples
31	Polygonum Persicaria	Lady's Thumb	28 samples
32	Lepidium virginicum	Wild Peppergrass	26 samples
33	Koellia flexuosa	Mountain Mint	26 samples
34	Syntherisma sanguinalis	Large Crab-grass	24 samples
35	Silene antirrhina	Sleepy Catch-tly	23 samples
36	Vicia sativa	Spring Vetch	23 samples

TABLE NO. 4-CONTINUED.

	Scientific Name	Common Name	Found in
37	Carex cephalophora	Oval-headed Sedge	22 samples
38	Panieum eapillare	Witch-grass	22 samples
39	Valerianella sp	Corn Salad	21 samples
40	Syntherisma linearis	Small Crab-grass	20 samples
41	Veronica arvensis	Corn Speedwell	20 samples
42	Bursa Bursa-pastoris	Shepherd's Purse	19 samples
43	Daucus carota	Wild Carrot	18 samples
44	Panicularia nervata	Nerved Manna-grass	18 samples
45	Plantago aristata	Large-bracted Plantain	16 samples
46	Conringia orientalis	Hare's-ear Mustard	16 samples
47	Prunella vulgaris	Heal-all	16 samples
48	Allium vineale	Wild Onion	15 samples
49	Lithospermum arvense	Corn Gromwell	15 samples
50	Anthyllis Vulneraria	Kidney Vetch	15 samples

CLEANING TOBACCO SEED.

Two years ago this Division began a new line of work, that of cleaning tobacco seed for farmers of the State. Most gratifying reports have been received from persons for whom seed was cleaned. The following shows the trend of opinion among the tobacco farmers in regard to this new line of work:

"The tobacco seed I had cleaned by the Department of Agriculture last year I gave to one hundred and twenty-five farmers, and find them all pleased with the seed. I want to say that I find a great difference in the results

where seeds are cleaned. "First. I get stronger plants on beds, and have no small, inferior plants. "Second. The tobacco lives better; not having to replant, grows evenly, not having any late, inferior tobacco to contend with.

"Third. It matures uniformly, making the housing of the crop easier.
"Fourth. I get a better grade of tobacco, heavier and more uniform.
"Fifth. Better plants, regular growth, uniform maturity, heavier crops, and better prices I find to be the result of cleaned seed, with which I am much pleased. I am sending you today my seed for this year to be cleaned."

From a very small beginning this work has grown till during the past year we recleaned and returned to the tobacco farmers enough seed to plant over 43,000 acres of tobacco. The farmers are thus appreciating the importance of clean seed for the tobacco crop as well as for other crops.

The planting of clean seed of high vitality is of such importance that it is hoped the tobacco farmers of the State will take advantage of the opportunity the Department offers and have all of their seed cleaned. This work can be done more efficiently by the Department than by the farmers, as the Seed Laboratory has special apparatus for doing this work. Several times the quantity of seed desired for sowing should be sent to insure a sufficient quantity of cleaned seed. The seed should be sent some time before it is wanted. The Department makes no charge for cleaning tobacco seed.

HOW TO SEND SEED SAMPLES FOR TESTING.

Of the smaller seed, such as the grasses and clovers, about three or four tablespoonfuls is a sufficient amount to send for testing. Of the larger seeds, as corn and oats, about a cupful is necessary. The following information should accompany all samples: Name and address of wholesale and retail dealer, retail price, and name and address of sender. Samples should be securely wrapped and addressed to

SEED THOUGHTS FOR NORTH CAROLINA FARMERS.

- 1. Send samples of your seed to the North Carolina Seed Laboratory for examination and test before you buy. It will pay you; there is no charge.
- 2. The North Carolina Seed Laboratory is all yours. Use it for your own personal gain. Five cents will bring it right to your door, where it will solve your seed problems, free of charge.
- 3. Know what you are about to buy before you get it—you can't take seeds out of the ground after they have been sown.
- 4. Send your tobacco seeds to the North Carolina Seed Laboratory and have them recleaned—it will pay you, and we bear the expense.
- 5. Ask your seedsman why he refuses to guarantee the purity or the germination of his seed. If he will not guarantee his goods, send us a sample before you buy and find the reason—you may decide to let them remain HIS goods.
- 6. Send three or four tablespoonfuls of your grass, clover and other small seeds and about a cupful of corn, wheat, oats, peas and other seeds of this size when submitting a sample to the Laboratory for examination. Write your name and address plainly on the package and address it to the "North Carolina Seed Laboratory, Department of Agriculture, Raleigh, N. C." State whether you want us to examine it for PURITY or GERMINATION.
- 7. Do not buy or use "feed" oats for seed oats—they may have been heated in the bin and may fail to come up.
- 8. Seeds containing wild onions, wild mustard, couch grass, Canada thistle, wild oats, clover or alfalfa dodder, corn cockle, dog fennel, cheat, or wild carrot are unlawful for sale, for seeding purposes, in North Carolina.
- 9. Would you sell your neighbor seed too impure and dirty to sow on your own land? Then do not sell such seed to the seed dealer—your neighbor or some other man's might get them from the seedsman.
- 10. It is an agricultural sin, if not a moral crime, to sell clover seed containing dodder or seed wheat containing onions or cockle from your farm to a seedsman. Better sell such seed to your neighbor, who will then know whom to sue for damages.
- 11. All legitimate seed dealers in North Carolina have a license. Beware of the seed fakir who asks fabulous prices for ordinary seeds. Buy from honest seedsmen and leave the seed peddlers alone.
- 12. Watch the man who is willing to sell you seed without having a license. If he is willing to break the law for YOUR benefit, he might be willing to sell you inferior seeds for HIS benefit.
 - 13. How many of your clover seed will come up from every hundred planted?
 - 14. When your seed fail to come up you lose doubly.

15. The North Carolina Seed Act fixes the standards of germination and purity for the following agricultural seeds. Purity means freedom from weed seeds and other foreign seeds; viability means germinating power or the ability to come up when planted.

	Per Cent of	Per Cent of
Name of Seed		Viable Seed
Alfalfa	. 96	80
Barley		90
Blue grass, Canada		45
Blue Grass, Kentucky	. 80	45
Brome, awnless	. 90	75
Clover, alsike	. 96	75
Buckwheat	. 96	90
Clover, crimson		85
Clover, red		80
Clover, white	. 90	75
Corn, field	. 99	94
Corn, sweet		75
Fescue, meadow	. 95	85
Flax		89
Millet, Pearl		65
Millet, common	. 90	85
Millet, hog		85
Oats		90
Oat grass, tall	. 72	70
Orchard grass	. 70	70
Rape	. 99	90
Redtop		70
Rye		90
Rye grass, perennial	. 96	90
Rye grass, Italian	. 95	80
Sorghum	. 96	80
Sorghum for fodder	. 90	60
Timothy	. 96	85
Wheat	. 98	90

16. Wheat does not "turn to cheat," but seed wheat containing onions and cockle will cheat you out of a first-class crop.

17. Pestiferous weeds, like other troubles, are generally imported. See that you do not "import" weed seeds along with your other seeds

from your seed dealer.

18. Dodder, wild carrot, cheat, wild onions, wild mustard, ox-eye daisy, bristly buckhorn, bracted plantain, Canada thistle, Russian thistle, nut grass, knawel, spiny pigweed, crab grass, sheep sorrel, smart weed, Spanish needles, dog fennel, and most other bad weeds are all imported into this country from Europe, or some other country, in impure seeds.

19. How long did it take you to rid your wheat fields and pastures of wild carrots and wild onions? These pests were imported from Europe

in impure seeds.

20. Sow only good, clean seed.

21. Are your seed oats and seed wheat clean, or, are they full of dirt, cheat, and onions?

22. Any plant in your field different from the crop you are trying to grow is a weed.

23. Reclean your wheat before sowing—it will pay you.

24. Treat your wheat and oats for smut by immersing the seed for thirty minutes in a solution of a pint of formalin in fifty gallons of water.

25. What is your method of ridding your fields of dodder, or the yellow "love vine?" This pest was also imported from Europe.

26. Those yellow spots of dodder in your clover fields are cancers that eat the vitals out of your clover crop. Quarantine this pest as you would smallpox.

LETTER OF TRANSMITTAL.

Hon. W. A. GRAHAM,

Commissioner of Agriculture.

Sir:—I submit herewith manuscript covering the inspection and analysis of concentrated stock feeds during the past year. I recommend its publication as the October Bulletin.

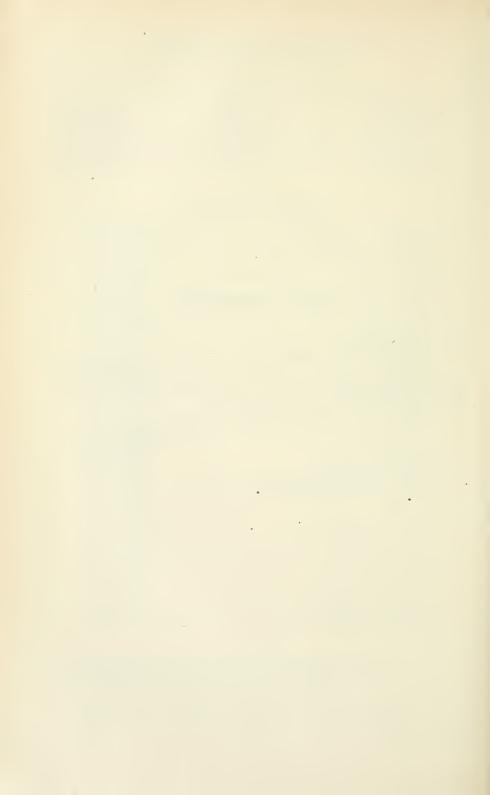

Very respectfully,

B. W. KILGORE,

State Chemist.

Approved for printing:

W. A. GRAHAM, Commissioner.

COMMERCIAL FEEDS

J. M. PICKEL, FEED CHEMIST.*

The analyses of concentrated commercial Feeding Stuffs published in this Bulletin comprise all those made during the year ending midsummer, 1914. The total number of samples analyzed is 375, of which 287 samples are official, that is, were drawn by our official inspector; the remainder, 88, are unofficial, that is, were sent in by citizens of the State.

There were in all 954 guarantees; in 270 cases (28 per cent) the feeds were below guarantee; the remainder (72 per cent) up to, or above guarantee. The discrepancy below or above guarantee was usually insignificant. If only cases in which protein and fat were respectively 1 or more per cent and 0.5 or more per cent below guaranteed, and fiber 1 or more per cent above, or taken into account, then of the total 954 guarantees only 11 per cent were not as good as guaranteed.

The following table gives a general summary of the different classes of feeds analyzed, the number of each, the number of guarantees on protein, fat and fiber; the number of cases, and their percentage, that

fell below guarantee:

^{*}Assisted by J. Q. Jackson, E. S. Dewar, W. H. Stroud. Only a small fraction of the time—as much as is implied by the making of the protein determinations—of these gentlemen was given to the work of this bulletin. In addition to the duties of feed chemist, Dr. Pickel has charge of the toxicological and water work of the Department.

REQUIREMENTS OF THE STATE FEED LAW.

The following ruling and regulations adopted by the Board of Agriculture under authority of Section 9 of the State Feed Law gives the chief points of the law with which every manufacturer must comply before offering feeds for sale in this State, also the rulings and definitions which have been adopted for the enforcement of the law.

First. All manufacturers, agents, or dealers who propose to sell or offer for sale any commercial feed in this State must apply to the Commissioner of Agriculture for blank forms on which they will be required to register the name or brand of the feed which they propose to sell, their own names and addresses, and also the places where their goods are manufactured: Provided, if a person desiring to so register is not the actual manufacturer, he may be permitted to register and guarantee the product, using the words "manufactured for and guaranteed by." They must also give the guaranteed analysis of their goods, stating the minimum percentage of protein and fat which they contain and the maximum percentage of crude fiber. They must also register the various ingredients of which their feeds are composed.

Second. All feeds must be offered for sale in sacks or packages of uniform capacity, as prescribed in Section 1 of the Act; that is, bags or packages must contain 25, 50, 75, 100, 125, 150, 175, or 200 pounds each. Manufacturers or dealers will be required to furnish the analysis tags which must be attached to these sacks or packages. On these tags must be clearly printed all the essential information given in the registration above, as illustrated below. Said tags must measure not less than $4\frac{1}{2} \times 2\frac{1}{2}$ inches. Guarantee tags must be printed in plain type with black ink. Rubber stamps will not be recognized on guarantee

tags.*

Third. Three guarantees are required, viz.: the minimum percentage of crude protein and crude fat and the maximum percentage of crude fiber. In other words, the crude protein and crude fat in a manufacturer's goods must not be less than his guarantee, and the fiber must' not be above his guarantee. The percentage of carbohydrates may be stated, but this is not required. The names of the ingredients of which

the feed is composed must be plainly printed on the tag.

Fourth. Definitions have been adopted for a number of feeds. In such eases where a feed or feed material is covered by a definition the feed must correspond within reasonable limits to the definition which has been adopted for it. With all feeds covered by definitions and all other feeds or mixtures of feeds the manufacturer is required to make his own minimum guarantee of protein and fat and his maximum guarantee of fiber: Provided, that no mixed feeds will be accepted for registration or allowed to be offered for sale in this State that contain less than 9 per cent crude protein, except mixtures of whole or partially ground grains.

When grain screenings containing weed seeds which have feeding value are used in mixed feeds such screenings and seeds must be ground in such manner as to destroy the viability of the seeds.

Sixth. It is optional with manufacturers or sellers whether the sack be branded, although that is always desired; but the required items

^{*}See page 23 for requirements when poultry feeds are put up in smaller packages than 25 lbs.

must always be printed on the tag in black-colored ink, but not printed with a rubber stamp. The tax stamp must be affixed to the tag, preferably alongside the printed matter, but in case of necessity may be

attached to the back of the tag.

Seventh. Feeds may be shipped in bulk from one manufacturer direct to another manufacturer who expects to subsequently sack and tag the same; but in this case the shipper, in consideration of this permission, must notify this Department at the time of the shipment of the name and consignee and the tonnage shipped; otherwise, the whole shipment will be subject to seizure as being untagged and unstamped.

Eighth. The principal adulterants employed in the feed trade are out hulls, barley hulls, rice hulls, corncobs, peanut shells, screenings, corn bran, and cotton-seed hulls. Some of the above may be found legitimately in a feed consequent to the grinding of the whole seed, but when used out of proper proportion or in excess of the amount obtained in grinding the whole seed, or when foreign to the product, or if injurious to the health of domestic animals, will be considered an adulteration.

Ninth. If any substance, such as chaff, screenings, damaged, faulty, or unlike seeds or grains or foreign materials be mixed with or added to feeds as an adulterant and not plainly marked on the package containing it or in which it is offered for sale, showing the true composition of the mixture, it will be considered a violation of the law; e. g., if oats be mixed with screenings and shrunken seeds or barley, the proper method of branding would be "Oats and Screenings," "Oats and Barley."

Tenth. When wheat bran and screenings are mixed, the mixture shall be branded "Wheat Bran and Screenings," and the word "Screenings" shall appear in the same size type as the words "Wheat Bran."

Eleventh. The sale of poultry and cattle feed which contain poisonous weed seeds in appreciable quantities, such as corn cockle and jimson weed (Jamestown weed), are forbidden.

Twelfth. When corn bran is mixed with wheat bran, the mixture shall not be branded "Bran," but shall be branded "Mixed Bran," or

be sold under a trade name, and be so registered.

Thirteenth. When corn bran is mixed with wheat bran and wheat middlings, the mixture shall not be branded "Bran and Middlings," or "Bran and Middlings Mixed," but shall be branded "Mixed Feed" or "Feed" or be sold under a trade name, and be so registered.

Fourteenth. When corn bran is mixed with wheat middlings, the mixture shall not be branded "Middlings" or "Middlings and Bran," but shall be branded "Mixed Feed" or "Feed," or be sold under some

trade name, and be so registered.

Fifteenth. No feed shall be registered or allowed on sale in this

State under a name that is misleading as to its quality.

Sixteenth. The Commissioner shall have the power to require registration annually of any or all commercial feeds sold, offered or exposed for sale in this State.

Seventeenth. The Commissioner shall have the power to refuse to allow any manufacturer, importer, jobber, broker, agent, dealer, or any person or persons to lower the registration or guaranteed analysis of his or their product or products during the calendar year, unless satisfactory reasons are presented for making such change or changes.

Eighteenth. All cracked corn sold, offered or exposed for sale in this State made from damaged corn shall be branded "Damaged Cracked

Corn" or "Cracked Corn Made from Damaged Corn."

The following definitions for commercial feeds have been adopted by the Association of Feed Control Officials of the United States. Before these definitions were adopted by this Association the manufacturers affected were given hearings and every effort made to make the definitions accurate and fair. Definitions for products not included in this list will be added as soon as adopted by the Association:

DEFINITIONS

Adopted by Feed Control Officials of the United States.

Meal is the clean, sound, ground product of the entire grain, cereal or

seed which it purports to represent.

Chop is a ground or chop feed composed of one or more different cereals or by-products thereof. If it bears a name descriptive of the kind of cereals, it must be made exclusively of the entire grains of those cereals.

Screenings are the smaller imperfect grains, weed seeds and other foreign material having feeding value, separated in cleaning the grain.

Flax Plant By-Product is that portion of the flax plant remaining after the separation of the seed, the baste fiber and a portion of the shives, and consists of flax shives, flax pods, broken and immature flax seeds and the corticle tissue of the stem.

Alfalfa Meal is the entire alfalfa hay ground, and doe's not contain an admixture of ground alfalfa straw or other foreign materials.

Linseed Meal is the ground residue after extraction of part of the oil from ground flaxseed.

Blood Meal is ground dried blood.

Meat Scrap and Meat Meal are the ground residues from animal tissue exclusive of hoof and bone. If they contain any considerable amount of bone, they must be designated Meat and Bone Scrap, or Meat and Bone Meal. If they bear a name descriptive of their kind, composition or origin, they must correspond thereto.

Digester Tankage is the residue from animal tissue exclusive of hoof and horn specially prepared for feeding purposes by tanking under live steam, drying under high heat, and suitable grinding. If it contains any considerable amount of bone, it must be designated Digester Meat

and Bone Tankage.

Cracklings are the residue after partially extracting the fats and oils from the animal tissue. If they bear a name descriptive of their kind, composition or origin, they must correspond thereto.

Brewers' Dried Grains are the properly dried residue from cereals

obtained in the manufacture of beer.

Distillers' Dried Grains are the dried residue from cereals obtained in the manufacture of alcohol and distilled liquors. The product shall bear the designation indicating the cereal predominating.

Malt Sprouts are the sprouts of the barley grain. If the sprouts are derived from any other malted cereal, the source must be designated.

Buckwheat Shorts or Buckwheat Middlings are that portion of the buckwheat grain immediately inside of the hull after separation from the flour.

Rice Bran is the cuticle beneath the hull.

Rice Hulls are the outer chaffy coverings of the rice grain.

Rice Polish is the finely powdered material obtained in polishing the kernel.

Out Grouts are the kernels of the out berry with the hulls removed.

Out Hulls are the outer chaffy coverings of the out grain.

Out Middlings are the floury portion of the out groat obtained in the

milling of rolled oats.

Out Shorts are the covering of the out grain lying immediately inside the hull, being a fuzzy material carrying with it considerable portions of the fine floury part of the groat obtained in the milling of rolled oats.

Clipped Oat By-Product (term oat clippings not recognized) is the resultant by-product obtained in the manufacture of clipped oats. It may contain light, chaffy material broken from the ends of the hulls, empty hulls, light, immature oats and dust. It must not contain an excessive amount of oat hulls.

Corn Bran is the outer coating of the corn kernel.

Corn Feed Meal is the sifting obtained in the manufacture of cracked

corn and table meal made from the whole grain.

Corn Germ Meal is a product in the manufacture of starch, glucose and other corn products and is the germ layer from which a part of the corn oil has been extracted.

Grits are the hard, flinty portions of Indian corn without hulls and

Hominy Meal, Hominy Feed, or Hominy Chop is a mixture of the bran coating, the germ and a part of the starchy portion of the corn kernel obtained in the manufacture of hominy grits for human consumption.

*Corn Gluten Meal is that part of commercial shelled corn that remains after the separation of the larger part of the starch, the germ and the bran by the processes employed in the manufacture of cornstarch and glucose. It may or may not contain corn solubles.

*Corn Gluten Feed is that portion of commercial shelled corn that remains after the separation of the larger part of the starch and the germ by the processes employed in the manufacture of cornstarch and

glucose. It may or may not contain corn solubles.

*Cottonseed Meal is a product of the cottonseed only, composed principally of the kernel with such portion of the hull as is necessary in the manufacture of oil: Provided that nothing shall be recognized as cottonseed meal that does not conform to the foregoing definition and that does not contain at least 36 per cent of protein.

*Choice Cottonseed Meal must be finely ground, not necessarily bolted, perfectly sound and sweet in odor, yellow, free from excess of

lint, and must contain at least 41 per cent of protein.

*Prime Cottonseed Meal must be finely ground, not necessarily bolted, of sweet odor, reasonably bright in color, yellow, not brown or reddish, free from excess of lint, and must contain at least 38.6 per cent protein.

Those marked thus* have not been considered or accepted by the N. C. Board of Agriculture.

*Good Cottonseed Meal must be finely ground, not necessarily bolted, of sweet odor, reasonably bright in color and must contain at least 36 per cent of protein.

*Cottonseed Feed is a mixture of cottonseed meal and cottonseed

hulls, containing less than 36 per cent of protein.

*Cold Pressed Cottonseed is the product resulting from subjecting the whole undecorticated cottonseed to the cold pressure process for the extraction of oil, and includes the entire cottonseed less the oil extracted.

*Ground Cold Pressed Cottonseed is the ground produce resulting from subjecting the whole undecorticated cottonseed to the cold pressure process for the extraction of oil, and includes the entire ground cotton-seed less the oil extracted.

Wheat Bran is the coarse outer coatings of the wheat berry obtained in the usual commercial milling process from wheat that has been cleaned and scoured.

Shorts or Standard Middlings are the fine particles of the outer and

inner bran separated from bran and white middlings.

*Wheat White Middlings or White Middlings are that part of the offal of wheat intermediate between shorts or standard middlings and red dog.

Shipstuff or Wheat Mixed Feed is a mixture of the products other

than the flour obtained from the milling of the wheat berry.

Red Dog is a low grade wheat flour containing the finer particles of bran.

*Wheat Bran with Mill Run Screenings is pure wheat bran plus the screenings which were separated from the wheat used in preparing said bran.

*Wheat Bran with Screenings not Exceeding Mill Run is either wheat bran with the whole mill run of screenings or wheat bran with a portion of the mill run of screenings, provided that such portion is not an inferior portion thereof.

Cottonseed Feed.—All mixtures of cottonseed meal and hulls containing less than 38.62 per cent protein shall be branded Cottonseed Feed, or a name may be given which does not contain the word "meal" or any

other word that might be misleading.

[Note.—This definition of cottonseed feed, and not that of the Feed Control officials, is in force in this State.]

HEARINGS.

When a sample of commercial feed examined shows variation from the guarantees, the dealer or manufacturer from whom the sample was taken shall be given an opportunity to be heard in his defense by the Commissioner before the facts may be certified to the proper prosecuting attorney.

It is the duty of the Department of Agriculture to regularly inspect the feeds offered for sale in the State and to see that all feeds bear the tax stamp and are properly labeled. The Department is required to collect and analyze at least one sample of every brand of feed found on sale in the State during the year and to publish the results for the benefit of those interested in this class of goods.

The Department will be glad, at any time, to furnish information re-

garding the character and value of any class of feed.

TERMS USED IN ANALYSIS.

Ash. This is the incombustible part of the plant, earthy matter drawn from the soil by the plant, and taken over into the animal organism from plants.

Protein. This is the nitrogenous portion of the plant. Lean meat,

white of eggs, curd of milk, gluten of grain are examples.

Fiber. The frame-work of the plant; trunk and stem are hardened fiber mixed with mineral and other matter; cotton is almost pure fiber.

Fat. The portion of plant soluble in ether is classed as fat, but includes small quantity of substances other than fats. Cotton-seed oil, olive oil, peanut oil, the oils of cereals are examples. Tallow, lard, butter and the various animal oils and fats fall into this class.

Nitrogen-free Extract. Starch, the various sugars, gums are examples. Carbohydrates. This is a general term, including fiber and nitrogen-

free extract.

ANIMAL FEEDING AND NUTRITION.

A fundamental distinction between plants and animals is this: Plants manufacture, so to speak, foods; animals consume, but cannot manufacture, food. They merely transform—more or less modify—the food they get from plants, utilize it for their own growth and maintenance and for doing work, or else store it up in their bodies or, as in the

case of milk, excrete it.

Animals get the mineral matter for forming bone from plants, a small portion also from water. The function of the carbohydrates and fats in animal nutrition is the production of warmth and energy; for this purpose fat has two and four-tenths the value of carbohydrate pound for pound. The function of protein is to build up, repair and sustain the vital portions of the animal organism,—blood, muscle, nerve, brain; the fats and carbohydrates cannot do this. Protein is capable also of being oxidized, or burned, in the body and producing warmth and energy; and in the absence of adequate fats and carbohydrates is thus utilized; but this is, beside being extravagant, unwholesome. A well balanced ration is one that contains protein, fat, carbohydrate in proper proportion to meet the needs of the animal. These needs vary with the kind of animal, its age and uses.

The following are excellent hand-books on animal feeding and nutri-

tion:

"Feeds and Feeding" by Prof. W. A. Henry; "Profitable Stock Feeding" by Prof. H. W. Smith; "Manual of Cattle Feeding" by Prof. H. P. Annsby; "The Feeding of Animals" by W. H. Jordan.

COMPOSITION OF SOME PURE UNADULTERATED FEEDING STUFFS.

Compiled from "Henry's Feeds and Feeding," whose tables are taken

mainly from Farmers' Bulletin 22, U. S. Dept. of Agriculture

By comparing the analyses in this table with the analyses of feeding stuffs, collected in this State, whose analyses are published in this Bulletin, one may gain an idea of the purity and worth of these feeding stuffs.

UNADULTERATED FEEDING STUFFS

	Percentage Composition			
	Protein	Fat	Fiber	
Corn, dent	10.3	5.0	2.2	
Flint	10.5	5.0	1.7	
Meal	9.2	3.8	1.9	
Cob	2.4	0.5	30.1	
Bran	9.0	5.8	12.7

Beet pulps	89.8	0.9		2.4			

ADULTERANTS.*

The following materials, when mixed with feeds without sufficient labeling to indicate their presence are considered adulterants: corn bran, rice hulls, ground corncobs, peanut hulls, peanut middlings, oat hulls, mill sweepings, screenings, cotton-seed hulls, and similar products.

ANALYSES OF FEED ADULTERANTS

	Protein (N x 6.25)	Fat (Ether Extract)	Fiber %	Nitrogen- free Extract	Water %	Ash %
Corn bran	7.00	2.82	11.89	65 .44	11.08	1.77
Rice hulls	3.60	0.70	35.70	38.60	8.20	† 13.20
Corn cobs	2.40	0.50	30.10	54.90	10.70	† 1.40
Peanut hulls	4.56	0.81	67.31			2.17
Spanish peanut hulls	10.12	2.70	31.33	29.98	5.89	19.98
Peanut middlings	8.75	0.88	40.75			16.75
Oat hulls	2.63	1.08	31.49	53.83	5.64	5.33
Wheat screenings	13.88	2.80	3.49	64.71	10.75	4.37
Cottonseed hulls with lint	3.25	1.12	46.92	40.11	6.05	2.55
Cottonseed hulls, delinted	2.40	0.31	36.49	50.22	8.20	2.38

WHEAT BRAN.

(Analyses on pages 24-29.)

Fifty-seven samples of wheat bran were analyzed, of which 49, or 86 per cent, were official. The following tabulation will give at a glance the results of the analyses:

	Percentage Composition						
	Protein	Fat	Fiber				
Guarantee		3.00 to 5.35 2.66 to 6.12 11 or 22 0.06 to 1.34 0.01 to 1.95	4.71 to 11.00 4.86 to 10.58 39 or 80 0.05 to 3.42 0.50 to 1.55				

It will thus be seen that the article sold as wheat bran varies greatly in feeding value—as much as 30 per cent in protein and 100 per cent in fat. This variation is not due, except in rare cases, to adulteration. There is, however, no adequate variation in price to correspond with greater or less feeding value. The price of wheat bran throughout the State the past year was \$1.60, \$1.65, \$1.70, and \$1.75 per 100 lbs. The same dealer, in the same town, on the same day, quoted bran:

^{*}Reprinted from Bulletin of November, 1912.

[†]Deficient here, and throughout this bulletin, means below guarantee; and note that to be below guarantee in the case of fiber is to be better than guarantee.

	Percentage Composition						
		Protein	Fat	Fiber			
\$1.75 per 100 pounds \$1.60 per 100 pounds	{ Guaranteed	16.00 16.37 17.13 13.50	5.00 4.65 4.09 4.19	6.00 4.86 6.50 6.82			

In the first case, a dollar would buy 9.3 pounds of protein and 2.6 pounds of fat; whereas in the case of the lower-priced article, owing to its inferior quality, a dollar would buy 8.4 pounds of protein and 2.6 pounds of fat. If the first, or higher priced, goods was worth \$1.75 per 100 pounds, the lower priced goods was worth not \$1.60 but \$1.44 per 100 pounds. It must not be inferred that the inferiority of the latter was due to adulteration; it was not; the goods was what is claimed to be, pure wheat bran. A compilation by the U. S. Dept. of Agriculture of 88 analyses of wheat bran gives the following range of constituents.*

	Pe	ercentage Compositi	on
	Protein	Fat	Fiber
Average	12.1 to 18.9 15.4	1.5 to 7.0 4.0	2.4 to 15.5 9.0

WHEAT MIDDLINGS, SHORTS, RED DOG.

(Analyses, pages 30-35.)

Seventy samples, of which sixty-three are official, are reported here. Their range of composition is shown in the following tabulation:

	Percentage Composition							
	Protein Fat		Fiber					
Guaranteed	10.00 to 19.00 13.00 to 19.50 11 or 17 0.02 to 2.12 0.25 to 5.00	3.00 to 6.00 2.35 to 6.83 13 or 20.5 0.01 to 2.15 0.02 to 2.00	2.13 to 11.00 1.20 to 9.02 53 or 84 0.08 to 5.61 0.10 to 1.98					

Here, also, is a wide range of feeding value: but prices do not vary according to feed value. The following tabulation will show this discrepancy between price and feeding value:

^{*}Bulletin No. 11; 1892.

			Percentage Composition		
			Protein	Fat	Fiber
April 16, 1914	\$1.80 per 100 pounds	{ Guaranteed Found	19.02 19.50	5.33 5.58	4.38
March 31, 1914	2.00 per 100 pounds	Guaranteed	16.00 17.75	4,50 4.65	7.00 1.39

Both these samples are *Red Dog* (Minnesota goods); each is high grade, better than it is guaranteed to be. The first, quoted at \$1.80 per hundred pounds, is quite appreciably better than the latter, although it was quoted 20 cents higher.

Red Dog was quoted the past year at \$1.80, \$1.90, \$1.95, \$2.00 per

100 pounds.

Shorts or middlings were quoted at \$1.60 by leaps of 5 cents all the way up to \$2 per 100 pounds. Here also prices do not vary with feeding value, as witness the following:

			Percentage Composition		
			Protein	Fat	Fiber
January 20, 1914	\$1.60 per 100 pounds	Guaranteed	16.00 18.00	4.50 4.80	4.00
June 16, 1914	2.00 per 100 pounds	{ Guaranteed Found	15.00 15.50	4.00 3.78	4.00 2.73
June 16, 1914	1.60 per 100 pounds	{ Guaranteed Found	15 .00 16 .88	5.00 5.60	9.00 6.57

Here are two quotations on the same day, June 16, and they were made in the same town. This indicates that the man who on that day paid \$2 per 100 pounds for his middlings could have gotten a better article "just around the corner" for \$1.60.

MIXTURES OF BRAN, SHORTS AND SCREENINGS.

(Analyses, pages 36, 37.)

The number analyzed is seventeen, eleven being official. The variation in composition is indicated below:

	Percentage Composition				
	Protein	Fat	Fiber		
Guaranteed	14 50 to 17.50 13.37 to 16.38 6 or 55 1.12 to 3.12 0.06 to 2.30	4.00 to 5.02 3.50 to 5.32 5 or 45 0.06 to 0.76 0.05 to 0.90	6.00 to 12.00 4.43 to 9.08 11 or 100 0.45 to 3.14		

TRADE-NAME MIXTURES OF WHEAT BRAN, MIDDLINGS AND SCREENINGS.

(Analyses, page 38, 39.)

Fifteen samples, all official, were analyzed.

	Percentage Composition			
	Protein	Fat	Fiber	
Guarantee	14.00 to 16.00 13.63 to 17.00 7 or 46.6 0.12 to 1.38 0.13 to 1.00	3.83 to 4.50 3.27 to 5.42 6 or 40 0.02 to 0.73 0.05 to 1.42	7.00 to 9.10 3.82 to 7.08 15 or 100 0.74 to 4.18 0.00 to 0.00	

SHIPSTUFF.

(Analyses, pages 40-43.)

Twenty-six official and four unofficial samples are reported. The range in composition summarizes as follows:

	Percentage Composition			
	Protein	Fat	Fiber	
Guaranteed. Found Deficient Range of deficiency Range of excess	14.00 to 16.00 14.12 to 17.38 6 or 23 0.25 to 0.75 0.13 to 1.76	4.00 to 5.00 3.55 to 5.90 11 or 42 0.03 to 1.12 0.03 to 1.54	2.57 to 7.00 4.14 to 7.13 19 or 73 0.14 to 1.62 0.04 to 2.88	

The prices quoted on Shipstuff the past year were \$1.70, \$1.75, \$1.80, \$1.85, \$2.

The following quotations were given in the same town on two consecutive days by different firms:

			Percentage Composition		
			Protein	Fat	Fiber
March 30, 1914	\$1.70 per 100 pounds	{ Guaranteed Found Guaranteed Found	15 .00 17 .38 16 .00 16 .50	4.00 5.35 4.00 4.65	6.00 5.45 5.00 5.36

If the first was worth only \$1.70, the second should have sold not for \$2, but for \$1.61 or thereabout.

MIXED FEEDS NOT CONTAINING MOLASSES.

(Analyses, pages 44-49.)

Forty-seven official and twelve unofficial samples were analyzed, These feeds vary greatly in value.

	Percentage Composition				
	Protein	Fat	Fiber		
Guaranteed	8.75 to 19.00	2.00 to 8.00	1.75 to 15.00		
Found	7.50 to 19.00	1.22 to 8.02	1.05 to 18.97		
Deficient	17 or 36	26 or 55	34 or 72		
Range of deficiency	0.12 to 3.37	0.03 to 1.77	0.05 to 4.53		
Range of excess	0.11 to 2.88	0.02 to 1.02	0.16 to 3.97		

The prices asked for these feeds range from \$1.65 to \$2 per 100 pounds. In as much as they are compounded, it is to be expected that their prices will be fixed according to their feeding value. The following two feeds carry out this idea in a measure. The first consisted of crushed oats and cracked corn. The second of oats and cracked corn:

			Percentage Composition		
			Protein	Fat	Fiber
January 12, 1914	\$2.00 per 100 pounds	{Guaranteed Found	10.00 °	4.50	6.50 4.76
January 14, 1914	1.85 per 100 pounds	Guaranteed Found	9.38 9.50	4.38 3.32	3.25 . 3.20

If the last is worth \$1.85, the first should be worth about \$2.12. The following two quotations illustrate the great difference in feeding value between goods that sell sometimes at the same price.

			Percentage Composition		
			Protein	Fat	Fiber
June 16, 1914	\$1.75 per 100 pounds	Guaranteed	8.75 7.50	2 .75 1 .22	1 .75 1 .05
June 18, 1914	1.75 per 100 pounds	Guaranteed	16.50 15.63	3.50 3.07	14.00 9.75

The first claimed to be "corn goods," and consisted mainly of corn meal. The latter consisted of corn, cotton-seed meal, alfalfa, and oat clips. On the face of the analysis, the last should have about twice the feeding value of the first named; but difference in digestibility would reduce it to much less than that, possibly to one and a half. The dry matter in corn meal is stated to be 88 per cent digestible; that in cotton-seed meal, alfalfa and oat chaff 76 per cent., 60 per cent., and 42 per cent, respectively.

MIXED FEEDS CONTAINING MOLASSES.

(Analyses, pages 50-57.)

Sixty-nine samples are reported, of these sixty-three were collected by the official inspector. The guarantees and analyses range as follows:

	Percentage Composition			
	Protein	Fat	Fiber	
Guaranteed	8.00 to 16.50 8.12 to 17.81 21 or 33 0.25 to 1.75 0.13 to 4.50	0.50 to 4.00 0.87 to 7.28 29 or 46 0.08 to 1.42 0.07 to 3.78	10.00 to 26.00 5.22 to 16.60 50 or 79 0.16 to 11.00 0.05 to 3.60	

The price of these goods ranged from \$1.60 to \$2 per 100 pounds; in one case \$2.25 was asked. Note the following quotations as compared to feeding value:

		Percen	Percentage Composition		
		Protein	Fat	Fiber	
,	\$2.00 per 100 pounds { Guaranteed Found	10.00 9.50 10.00 12.38	3.00 2.32 2.00 2.56	12.50 10.31 12.00 13.17	

The ingredients, except a little salt in the first, are the same, namely, alfalfa, cracked corn, oats, molasses; the guarantees are about the same, except as to fat. But the analysis indicates the last to be of appreciably greater feed value than the first. The foregoing quotations were in the same town. Take two other illustrations in the same town at about the same date as the foregoing:

		Perce	entage Com	position
		Protein	Fat	Fiber
March 30	(Guaranteed	10.00 11.50 15.00 15.38	2.50 1.68 3.00 3.12	12 .00 11 .25 12 .00 13 .51

If the first was worth \$1.75 per 100 pounds, the latter should, on the face of the analysis, be worth about \$2.35 or \$2.40. In the first case a dollar bought 6.6 pounds of protein and supposedly 1.4 pounds of fat, but actually barely 1 pound; in the latter case 8.7 pounds of protein and 1.6 pounds of fat. The ingredients of the first were alfalfa, cotton-seed meal, corn, molasses, oats: the ingredients of the last were the same

except rice straw instead of oats. There could, however, have been but little rice straw present, else the protein content would have been less and the fiber content greater; rice straw contains but little protein (4.7%), much fiber (3%) and little fat (2%).

POULTRY FEEDS.

Analyses, pages 58-61.)

* Twenty-six samples were analyzed. The range of guarantee and analysis stood thus:

	Percentage Composition						
	Protein	Fat	Fiber				
Guaranteed. Found. Deficient. Range of deficiency. Range of excess.	9.00 to 19.57 9.25 to 19.63 4 or 16 0.25 to 0.87 0.06 to 2.25	2.50 to 5.00 1.99 to 5.33 7 or 29 0.15 to 1.51 0.01 to 1.89	3.00 to 9.00 1.80 to 6.62 23 or 96 0.09 to 6.21				

The prices asked for poultry feed ranged from \$2 to \$3 per 100 pounds. The following quotations will indicate that this difference in price is not always justified by difference in feed value:

			Percentage Composition			
			Protein	Fat	Fiber	
March 30, 1914	\$2.00 per 100 pounds	Guaranteed Found	10.00 12.25	3.00 3.31	5.00 2.57	
May 25, 1914	3.00 per 100 pounds	$\left\{ \begin{array}{l} \text{Guaranteed} \\ \text{Found} \end{array} \right.$	12.00 12.00	3 .00 3 .00	4.00 3.52	
June 16, 1914	2.50 per 100 pounds	Guaranteed	10.00 10.63	3.50 2.82	4.00 2.01	

Ingredients of the first: cracked corn, kafir corn, wheat, buckwheat.
Ingredients of the second: corn meal, gluten, middlings, bran, oatmeal, hen-e-ta.

Ingredients of the third: cracked corn, kaffir corn, wheat, shells.

The two dollar stuff is undoubtedly better than the two-fifty stuff, and probably little inferior to the three-dollar stuff. Hen-e-ta is a phosphatic grit, for which great claims are made.

COTTON-SEED MEAL AND COTTON-SEED FEED.

(Analyses, pages 62-65.)

The official samples of cotton-seed meal are collected mainly by the inspectors of fertilizers, and the analyses are published in the fertilizer bulletins, hence only very few are reported here. Standard cotton-seed meal is defined by our cotton-seed meal law to be one that contains

7.5% of ammonia, equivalent to 6.18% nitrogen, and 38.62% protein. If the goods contain less than 38.62% of protein, it must be branded "Cotton-seed Feed," or be designated by a name that does not contain the word "meal."

Two of the three official samples of meal reported here were 1.07% and 2.25% below guarantee (38.56%).

Five unofficial samples, sent in for analysis by private citizens, ranged from 31.88% to 39.8% protein, one only being above guarantee.

Six official samples of cotton-seed feed were guaranteed to contain 20 to 25% protein and were found to contain 20.63% to 27.76% of protein.

Lumping the cotton-seed meals and cotton-seed feeds together, they range as follows in guarantee and analysis:

	Percentage Composition				
	Protein	Fat	Fiber		
	-				
Guaranteed	20.00 to 38.56	3.00 to 6.00	12.00 to 23.00		
ound	16.87 to 39.87	3.83 to 9.49	7.78 to 24.80		
Ocficient	. 4 or 36	3 or 43	7 or 100		
Range of deficinecy	0.75 to 3.94	0.25 to 0.59	1.50 to 4.73		
Range of excess	0.56 to 4.50	0.65 to 3.25			

CORN, CRACKED CORN, CORN CHOPS, CORN BRAN.

(Analyses, pages 66, 67.)

Whole corn, or other grains, when unmixed, are not subject to the feed control law; one analysis (corn), however, is given here. Thirteen other analyses are reported, seven being of official samples. The cracked corn, imported into the State, was properly guaranteed; but there seems to be a tendency on the part of some manufacturers in the State to neglect this. However, the unguaranteed samples were of rather higher grade than the guaranteed. The range of guarantee and analysis (cracked corn) is as follows:

	Percentage Composition					
	Protein	Fat	Fiber			
Guaranteed	8.00 to 8.75 7.38 to 8.75 2 or 50 0.62 to 0.75 0.50 to 0.75	3.00 to 4.53 2.46 to 3.84 3 or 75 0.54 to 1.01 0.00 to 0.26	1.99 to 6.00 1.64 to 2.06 4 or 100 0.04 to 3.98 0.00 to 0.00			

One sample, corn chops (133), was found to be abnormally high in fat (7.20 per cent).

GLUTEN FEED, DRIED BEET PULP.

(Analyses, pages 68, 69.)

Only one analysis of gluten feed is recorded. This feed is rich in

protein, guaranteed 23 per cent, found 27 per cent.

Dried beet pulp, on the other hand, is low in protein and fat, high in fiber. The price asked for it—\$1.75 to \$2 per 100 pounds—would seem to be entirely too much for its feed value.

	Percentage Composition				
	Protein	Fat	Fiber		
Guaranteed Found Deficient Range of deficiency Range of excess	8.00 7.25 to 8.94 1 or 80 0.25 *	0.50 0.57 to 1.00	20.00 17.18 to 19.10 4 or 100 0.90 to 2.53 0.00 to 0.00		

RICE PRODUCTS.

(Analyses, page 70.)

Three samples, unofficial, sent by the manufacturer, were analyzed. Except a trivial deficiency (0.13 per cent) in protein, these feeds are all above guarantee. They are notably rich in fats.

POULTRY AND STOCK TONICS.

(Analyses, pages 70, 71.)

Four samples were analyzed. We get a good many enquiries as to the value of these stuffs. We cannot do better than repeat the advice given by Professor Henry of the Agricultural Department of the Uni-

versity of Wisconsin:

"As to these nostrums it may be said that vigorous, healthy animals do not make better use of their feed because of their addition. If animals are out of condition they should receive specific treatment according to their ailments. A good manager of live stock will have no use for these high-priced condimental foods or condition powders; a poor

manager will never have fine stock by employing them."

Some enquirers reveal a fear that these condiments may sometimes contain ingredients that are harmful. This is doubtless never the case, especially in view of the small quantities, or doses, in which they are administered. Their main body consists, as a rule, of one or more ordinary feed stuffs of standard value, including the following: "Corn, corn meal, hominy, feed corn, gluten meal, oats, hulled oats, wheat, wheat middlings, wheat bran, baked and kiln-dried rolled wheat, cotton-seed meal, linseed oil meal, crackers, alfalfa meal, meat meal, dried bone meal, dried beef and bone, beef scrap, dried blood, starch. Among the constituents of more or less medicinal value are: gentian, ginger, anise seed, fenngreek, mustard seed, pepper, fennel seed, rape seed, caraway seed, licorice, nuxvomica, cinchona bark, rosin, columbo, elecampane,

quassia, senna leaves, belladonna root, sassafras, camphor, epsom salts, table salt, glauber's salt, saltpeter, borax, copperas, soda, sodium hyposulphite, charcoal, sulphur, limestone, oyster shells, ferric oxide (Venetian red).

A particular tonic will, of course, contain only a few of the foregoing

ingredients.

"The Maine Mixture costs but 20 cents a pound; is concentrated instead of diluted, is all drug and not mostly feed stuff, and, hence, far stronger. It is probably at least as efficient as, and certainly far cheaper than, the generality of condimental feeds. The Maine Station suggests: Pulverized gentian, one pound; pulverized ginger, one-quarter pound; pulverized saltpeter, one-quarter pound; pulverized iron sulphate (copperas) one quarter pound. Mix; feed tablespoonful in feed once daily for ten days; omit three days; feed as above for ten days more."—From Bulletin No. 164, Vermont Experiment Station.

POULTRY FEEDS IN SMALL PACKAGES.

Poultry feeds may be put up in small bags, boxes or other containers of less than 25 pounds net weight: Provided first, That these containers be labeled with their net weight and the other usual guarantees; and, Provided further, That these smaller packages be enclosed in a larger bag or container of standard net weight of 25, 50, 75, etc., pounds; the said larger container to bear the requisite tax stamp and guarantees.

Hon. W. A. Graham,

Commissioner of Agriculture.

SIR:—I submit herewith analyses of fertilizers and cotton-seed meal made in the laboratory of samples collected during the past fall and spring. These analyses show fertilizers and meals to be about as heretofore, and to be, generally, what was claimed for them. I recommend that it be issued as the November Bulletin.

Very respectfully,

B. W. KILGORE,

Approved for printing:

State Chemist.

W. A. GRAHAM,

Commissioner.

I. ANALYSES OF FERTILIZERS, FALL SEASON, 1913; SPRING SEASON, 1914.

BY B. W. KILGORE, W. G. HAYWOOD, J. Q. JACKSON, E. S. DEWAR, AND J. R. MULLEN.

The analyses presented in this Bulletin are of samples collected by the fertilizer inspectors of the Department, under the direction of the Commissioner of Agriculture, during fall months of 1913 and the spring months of 1914. They should receive the careful study of every farmer in the State who uses fertilizers, as by comparing the analyses in the Bulletin with the claims made for the fertilizers actually used, the farmer can know by or before the time fertilizers are put in the ground whether or not they contain the fertilizing constituents in the amounts they were claimed to be present.

TERMS USED IN ANALYSES.

Water-soluble Phosphoric Acid.—Phosphate rock, as dug from the mines, mainly in South Carolina, Florida, and Tennessee, is the chief source of phosphoric acid in fertilizers.

In its raw, or natural, state the phosphate has three parts of lime united to the phosphoric acid (called by chemists tricalcium phosphate). This is very insoluble in water and is not in condition to be taken up readily by plants. In order to render it soluble in water and fit for plant food, the rock is finely ground and treated with sulphuric acid, which acts upon it in such a way as to take from the three-lime phosphate two parts of its lime, thus leaving only one part of lime united to the phosphoric acid. This one-lime phosphate is what is known as water-soluble phosphoric acid.

Reverted Phosphoric Acid.—On long standing some of this water-soluble phosphoric acid has a tendency to take lime from other substances in contact with it, and to become somewhat less soluble. This latter is known as reverted or gone-back phosphoric acid. This is thought to contain two parts of lime in combination with the phosphoric acid, and is thus an intermediate product between water-soluble and the original rock.

Water-soluble phosphoric acid is considered somewhat more valuable than reverted, because it becomes better distributed in the soil as a consequence of its solubility in water.

Available Phosphoric Acid is made up of the water-soluble and reverted; it is the sum of these two.

Water Soluble Ammonia.—The main materials furnishing ammonia in fertilizers are nitrate of soda, sulphate of ammonia, cotton-seed meal,

dried blood, tankage, and fish scrap. The first two of these (nitrate of soda and sulphate of ammonia) are easily soluble in water and become well distributed in the soil where plant roots can get at them. They are, especially the nitrate of soda, ready to be taken up by plants, and are therefore quick-acting forms of ammonia. It is mainly the ammonia from nitrate of soda and sulphate of ammonia that will be designated under the heading of water-soluble ammonia.

Organic Ammonia.—The ammonia in cotton-seed meal, dried blood, tankage, fish scrap, and so on, is included under this heading. These materials are insoluble in water, and before they can feed plants they must decay and have their ammonia changed, by the aid of the bacteria of the soil, to nitrates, similar to nitrate of soda.

They are valuable then as plant food in proportion to their content of ammonia, and the rapidity with which they decay in the soil, or rather the rate of decay, will determine the quickness of their action as fertilizers. With short season, quick-growing crops, quickness of action is an important consideration, but with crops occupying the land during the greater portion, or all, of the growing season, it is better to have a fertilizer that will become available more slowly, so as to feed the plant till maturity. Cotton-seed meal and dried blood decompose fairly rapidly, but will last the greater portion, if not all, of the growing season in this State. While cotton seed and tankage will last longer than meal and blood, none of these act so quickly, or give out so soon, as nitrate of soda and sulphate of ammonia.

Total Ammonia is made up of the water-soluble and organic; it is the sum of these two.

The farmer should suit, as far as possible, the kind of ammonia to his different crops, and a study of the forms of ammonia as given in the tables of analyses will help him to do this.

FORM OF POTASH IN TOBACCO FERTILIZERS.

Tobacco growers are becoming yearly more disposed to know the form of potash, whether from kainit, muriate, or sulphate, which enters into their tobacco fertilizers. Considerable work of this kind has been done for individuals, and we now determine the form of potash in all tobacco brands, for the benefit of tobacco growers.

The term potash from muriate, as reported in the analyses, does not mean, necessarily, that the potash was supplied by muriate of potash. Sulphate or some other potash salt may have been used, but in all fertilizers where the term potash from muriate is used, there is enough chlorine present to combine with all the potash, though it may have come from salt in tankage, kainit, or karnalite. As the objection to the use of muriate of potash in tobacco fertilizers arises from the chlorine present, it does not matter whether this substance is present in common salt or potash-furnishing materials.

The use of sulphate of potash where there is chlorine present in the other ingredients of the fertilizer will not prevent the injurious effect of the chlorine. The term potash from muriate in our analyses, therefore, means that there is sufficient chlorine present in the fertilizer from all sources to combine with the potash to the extent indicated by the analyses.

VALUATIONS.

To have a basis for comparing the values of different fertilizer materials and fertilizers, it is necessary to assign prices to the three valuable constituents of fertilizers—ammonia, phosphoric acid, and potash. These figures, expressing relative value per ton, are not intended to represent crop-producing power, or agricultural value, but are estimates of the commercial value of ammonia, phosphoric acid and potash in the materials supplying them. These values are only approximate, as the cost of fertilizing materials is liable to change as other commercial products are, but they are believed to fairly represent the cost of making and putting fertilizers on the market. They are based on a careful examination of trade conditions, wholesale and retail, and upon quotations of manufacture.

Relative value per ton, or the figures showing this, represents the prices on board the cars at the factory, in retail lots of five tons or less, for each.

To make a complete fertilizer the factories have to mix together in proper proportions materials containing ammonia, phosphoric acid, and potash. This costs something. For this reason it is thought well to have two sets of valuations—one for the raw or unmixed materials, such as acid phosphate, kainit, cotton-seed meal, etc., and one for mixed fertilizers.

The values used last season were:

VALUATIONS FOR 1913.

In Unmixed or Raw Materials.

For phosphoric acid in acid phosphate				
For phosphoric acid in bone meal and Peruvian Guano.	31/2	cents	per	pound.
For phosphoric acid in basic slag	4	cents	per	pound.
For nitrogen	$19\frac{1}{2}$	cents	per	pound.
For potash	4	cents	per	pound.
			-	_

In Mixed Fertilizers.

For phosphoric acid	41/2	cents	per	pound.
For nitrogen	21	cents	per	pound.
For potash	5	cents	per	pound.

VALUATIONS FOR 1914.

In Unmixed or Raw Materials.

For phosphoric acid in acid phosphate For phosphoric acid in bone meal and Peruvian Guano	4	cents	per	pound.
and basic slag				
For nitrogen				
For potash	4	cents	per	pound.

In Mixed Fertilizers.

For phosphoric acid	$4\frac{1}{2}$	cents	per	pound.
For nitrogen	21	cents	per	pound.
For potash	5	cents	per	pound.

HOW RELATIVE VALUE IS CALCULATED.

In the calculation of relative value it is only necessary to remember that so many per cent means the same number of pounds per hundred, and that there are twenty hundred pounds in one ton (2,000 pounds).

With an 8-2-1.65 goods, which means that the fertilizer contains available phosphoric acid 8 per cent, potash 2 per cent, and nitrogen 1.65 per cent, the calculation is made as follows:

Percentage or Lbs. in 100 Lbs.	Value Per 100 Lbs.	Value Per Ton, 2,000 Lbs.
8 pounds available phosphoric acid at 4½ cents	$0.10 \times 20 =$	2.00
Total value	$0.817 \times 20 =$	\$16.14

Freight and merchant's commission must be added to these prices.

LETTER OF TRANSMITTAL

HON. W. A. GRAHAM,

Commissioner of Agriculture, Raleigh, N. C.

Sir:—I beg to submit herewith a manuscript, a revision of Bulletin No. 8, discussing, in a brief way, some of the different lines of progress of agriculture in North Carolina during the recent past. To those who desire a full discussion of the agricultural development of the State this Bulletin will be painfully brief; but we have only to point out that it would require a good-sized volume to do the subject justice, and that the time at our command and the space allotted to us would not permit a fuller discussion of the subject. We have been able, therefore, in this paper to call attention to only a few things among the many that cause North Carolina to stand out prominently above many other states.

In the last part of the paper is found a brief discussion of the amount of food and feed products shipped into the State during 1913. Most of the data for this part of the paper were obtained from the books of the different railway companies doing an interstate business in North Caro-

lina.

I recommend the publication of this manuscript as a supplement from the Botany and Agronomy Division to the November Bulletin of this Department. Respectfully submitted,

Approved:

J. L. Burgess, Agronomist and Botanist.

W. A. Graham, Commissioner,

Progressive

Development of North Carolina Agriculture

WITH A BRIEF DISCUSSION OF

FOOD AND FEED PRODUCTS SHIPPED INTO NORTH CAROLINA DURING 1913

By J. L. BURGESS, Agronomist and Botanist.

STATUS OF THE FARMER.

Forty years ago North Carolina was a good state to be from; now it

is one of the very best states in the Union to be in.

Agriculture in those days was frequently thought of as a hardship imposed upon the unfortunates who had to "toil" the soil for a living, and was, in many cases, looked upon as an occupation suitable for only those who were either financially or mentally incapable of pursuing a

more popular calling.

But a change has come. Instead of being a drudgery and a despised menial occupation, as it once was, farming has, within the last two decades, been elevated to a position having the dignity of a profession, or a business, touching the intellect at every angle and taxing the mind to its utmost in grappling with the problems that daily arise on the farm for solution. Men everywhere are viewing the business of farming in a more favorable light. They are beginning to realize that there is no occupation more honorable, more necessary to the welfare of the State, or more deserving of the best efforts and energies in man, than that of tilling the soil. Indeed, all men are now insisting that it is the most noble of occupations, having been divinely instituted when man was first placed upon the earth, and Emerson has pointed out that "The first farmer was the first man, and all historic nobility rests on the possession and use of land."

THE FUNDAMENTAL CALLING.

It is a commonplace that agriculture is the foundation of all other occupations—mining, manufacture, commerce, etc. If we cease to plow, the miner will lay down his pick; factory wheels will stop; locomotives will stand cold and lifeless upon the tracks; abandoned ships will decay in the harbors; fishermen will cease to cast their nets; school children will come home to stay; church bells will cease to ring; and, very soon, savages will again roam over the face of the earth. An ample food supply, therefore, is essential to the highest moral, intellectual, and physical development of the human race. All wars, whether industrial or sanguinary are, in their last analysis, waged over an actual or fancied future scarcity of the necessarics of life. The mightiest factors in the

world's civilization today, then, are the smoke-house and the granary; and, whether we will or not, the modern Atlas is "The Man with the Hoe." Good farming then will ever be the foundation on which all real progress in civilization must be made.

AGRICULTURAL ADVANTAGES IN NORTH CAROLINA.

Location.

The fondest hopes of the farmer may be realized right here in North Carolina. New England has little to offer the man who wants to farm. Forty years ago many farmers very wisely left the Old North State for Missouri, Kansas, Nebraska, Iowa, etc., and there homesteaded 160 acres of land that are now worth, in many cases, more than \$32,000. A number of these men have sons who want to farm and can give them \$4,000 to \$6,000 with which to purchase land and equipment. But how much land can be purchased with \$4,000 at \$200 an acre. Few of them would be content with less than 80 acres, and to purchase this, without improvements, would require an outlay of \$16,000. Add \$4,000 for necessary improvements and he will have spent \$20,000 for his 80-acre farm, perhaps, before he has reaped a single harvest or realized a penny on his investment. It is plain, therefore, that a young man of average means in the central west must be a renter if he farms at all. Farther west and northwest, the climate is too cold for any but the hardiest Scandinavians or north European immigrants. In the far west prices are, again, too high and competition too acute for an eastern man of average means. Farther south the climate is too hot and malaria is so prevalent that the health of a man from this latitude would, under average conditions, likely be threatened. Coming back to North Carolina, we find here all the advantages the farmer has anywhere else in the country, and the additional advantage of living in a state destined to become one of the leading manufacturing states of the Union.

Capital has not been slow to accept the invitation tacitly held out by our location with reference to other states, and our strategic position with reference to the future manufacturing development of the coun-The 3,500,000 horse-power that but a few years ago was running to waste along the streams of the piedmont and mountain sections of the State is now being harnessed and utilized in the various manufacturing and other industrial enterprises. This immense power is just on the border of the cotton fields and among the forests and the mines. Our climates and soils are capable of producing more than enough to support the largest possible mill population that will ever be needed to manipulate the electric power generated by our streams. We have ample facilities for transporting raw materials and for handling an unlimited amount of finished products. No one is blind to our easy access to deep water on the coast, the Panama Canal, and thence to the Orient. Capital has seen its opportunity among us and has laid the foundation for

its own protection and our development.

MARKETS.

The greatest asset of any agricultural community is a good local market. There was a time when the North Carolina farmer looked in vain for a home market, but that time has passed. There was a time when no one seemed to want anything we had to sell, but economic conditions have so changed that nothing short of a national calamity is likely to reduce the present demand for the products of the North Carolina farm.

In respect to local markets, North Carolina is unexcelled and rarely equaled, by any state in the Union. We have no great metropolis like Baltimore or Washington to handle the bulk of our farm products, but we do have a large number of thriving cities.—Asheville, Gastonia, Charlotte, Winston, Salisbury, Greensboro, Monroe, Durham, Raleigh, Wilmington, Goldsboro, New Bern, Wilson, Rocky Mount, Tarboro, Kinston, Greenville Washington, Henderson, High Point, Elizabeth City, Favetteville, and a number of others,—ranging in population from 3,000 to over 30,000 and scattered broadcast over the entire State. It would be practically impossible for a farmer to locate in North Carolina and not be within easy reach of some good home market. The day is fast approaching when it will be unnecessary for the North Carolina farmer to look outside the State for a market for his staple products. This statement can hardly be called visionary when we note the increase in number and kinds of manufactories within our borders and the large towns and consequent good markets which necessarily attend these manufacturing enterprises. New England is coming south with her mills and markets. These industries are constantly calling for more labor, and, since only white labor is wanted, a large percentage of the white farmers that were on farms twenty years ago are now working in the mills. The former producers of farm products have been transformed into consumers of farm products and producers of finished mill products. In other words, the mills have collected men, women, and children from large extents of territory and thus made good local markets for those of the rural population who preferred to stay on the farm.

North Carolina has a population of hundreds of thousands more than Kansas, Nebraska, South Carolina, Tennessee, Alabama, or Mississippi, and more than the states of Colorado, Nevada, Idaho, Montana, Wyoming, Vermont, and Delaware all combined, with a very large percentage of it in the different manufacturing towns. This should give great emphasis to the importance of our local markets for farm products.

This fact is brought out clearly in the following table:

Table No 1—Showing Population of North Carolina as Compared with Other States—1910.

TRANSPORTATION.

Railroads.

No state in the South has better transportation facilities. Five great railroad systems are rushing through the State to reach deep water on the Atlantic coast, there to connect with steamers for the Panama Canal. Besides these, there are fifty-six other short lines and feeders that ramify the State like so many blood vessels in our great industrial system. Every farmer is thus put in easy reach of a good home market and is but a few hours from Charleston, Atlanta, Memphis, Chattanooga, St. Louis, Chicago, Pittsburg, Richmond, Washington, Baltimore Philadelphia, New York, and Boston.

Not only have we an excellent and rapidly growing system of railroad transportation, covering the entire State like a network, but in eastern North Carolina there is a veritable labyrinth of bays, sounds, canals, and navigable rivers on which there are thousands of boats, barges, and other vessels, handling farm produce between our own larger eastern cities and placing much of it on the markets of the cities to the

north and south of us.

Country Roads.

In addition to our superb railroad and water transportation facilities there was launched some years ago a general movement for better country roads in North Carolina. That movement is still going on with daily increasing momentum. As a result there is hardly a county in the State which has not built, or is not contemplating the building of, good macadam or sand-clay roads leading from the county seat, or principal town of the county, into its remotest agricultural districts. These main lines of good roads have secondary or "belt" roads leading into them which are also graded and made good. In a word, both the railroad and dirt road facilities in North Carolina are, in many counties, simply un-

surpassed by any State in the South and hardly equaled by any State in the Union. The farmers of North Carolina have been behind this good roads movement ever since its inception, thus showing the progressive spirit which pervades the agricultural classes of this State.

Telephones.

In addition to our superb transportation facilities, rural telephones are found everywhere, thus putting the farmer in immediate communication with the markets of his own locality and with those of distant localities at a cost ranging from seventy five cents to \$1.00 per month.

EDUCATION.

In North Carolina, as in every other state, education—agricultural education—lies at the foundation of all good and successful farming. The ignorant man can no longer "farm if he can do nothing else." The needs of the increasing population and the demands of refined taste require that not only a greater acreage production, but that a finer quality of product be placed upon the market, and this can be done by intelligent farming only. Poor lands cannot make high average acre-yields and rich lands can not produce fine quality when manipulated by unskilled hands. Regardless of the yield per acre, there is no land so poor as that of the ignorant farmer, and none so rich as that of the man who

knows how to manage his soils.

Gold mines and phosphate beds are but barren waste to the man who knows nothing of what is beneath the surface, while they are rich treasures to the man of trained mind and skilled hand. Less than forty years ago "Old Red Mountain" in Alabama was given "to boot" in a horse swap. Since then the vast deposits of iron ore stored away in those hills have built Birmingham and rolled millions upon millions of dollars into the coffers of the ironmasters. Why did not the original owner get a fortune out of these rich deposits of ore? And so it has been with the owners of many poor North Carolina farms. Hundreds of "old worn-out farms" have been sold or given to boot, as it were, by the erstwhile owners, who, failing to properly understand the local conditions and the possibilities of their acres, could not even support themselves and their families. The buyers, knowing the intrinsic value and nature of the soils, took the farms in hand for a nominal sum and have made a fortune where the original owners made a failure. The ones with their families are, perhaps, operatives in some cotton mill, while the others, with their families, are veritable lords of the land, using the cotton mill town as a market for their produce.

The locomotive existed in the mind of the inventor long before it stood upon the track. The statue always exists in the mind of the sculptor long before it emerges from the stone. So it is with the agricultural artist and the agricultural manufacturer. His ideal pork, beef, milch and draft animals, his maximum corn, wheat, and cotton crops exist in his mind months before they are found in the herd or in the field. The most fundamentally important things for farmers to possess, therefore, are not good land, good stock, good tools, good markets, and reliable labor, but correct ideals and proper vision. No castles were ever built on earth that were not first built in the air. These funda-

mental ideals come only by a careful and diligent study of the factors

controlling the development of any chosen vocation.

It means little to the farmer that farm products be high-priced if his profits are consumed in hauling them to market. It means little to the farmer to own land capable of producing 50 bushels of corn to the acre if his store of knowledge allows him to gather but 10 bushels from the acre. We must, therefore, have good roads, and good schools offering efficient agricultural instruction. But good roads and good schools alone will not make us a great agricultural state. These are but the tools with which we work. Nothing is further from the truth than the old adage that "knowledge is power." Knowledge is not power. It never has been. Power comes only as a result of an application of energy to knowledge. Every one has seen the walking encyclopedia whose brain is surcharged with facts but who never exerts any influence in his community. Every one has also seen the man of unbounded energy who didn't know what he wanted and had to have it—nervous. working, watching—always in a hurry and never getting anywhere; but when you find a man or woman possessed of great energy with an abundance of knowledge to direct it, you find a person who is a power in the land. There is not one volt more electro-motive force in the world today than there was 10,000 years ago, when it was manifested only in the thunderbolt and in the destructive shafts of lightning; but since the invention of the electric motor, even the cobbler in his shop uses the lightning as a beast of burden. The motor does not generate the power, neither does the electric current generate the power; but join the two together and every wheel in the industrial world may be propelled by the force. So it is with the farmer. When he has gained sufficient knowledge to give proper direction to his energy he will be proud to show us his fields of waving grain and his herds of fat cattle. Power, then, is ENERGIZED knowledge.

The North Carolina farmer has always had the energy, and within the last ten years he has, at a very rapid rate, been acquiring the knowledge. Twenty years ago the book farmer was looked upon as an idealist without practical ability. But conditions have changed. Since then not only have the farmers of North Carolina gone on record as favoring book farming, but have built schools and colleges for agricultural instruction, and our General Assemblies have passed laws putting agriculture into every public school in the State. At present the State Department of Agriculture, the United States Department of Agriculture, the A. and M. College, the State University, the State high schools, and practically every public school in the State are combining their efforts to dispel the mists from the eyes of the one man upon whose success the welfare of the entire State depends. Not only so, but there is a number of organizations among the farmers themselves that give promise of doing more to put farming in North Carolina on a sound business and scientific basis than any other agencies

that have ever existed within our borders.

RAW PRODUCTS.

Corn.

Corn grows in all parts of the State. It is our leading crop, and the yield is yearly increasing. It will be interesting to note that in 1913 the acre value of the corn crop of North Carolina was greater than that of either Georgia, Florida, Illinois, Missouri, North Dakota, South Dakota, Nebraska, Mississippi, Arkansas, Colorado, or New Mexico. Thus showing the special inducements in this State for the increased production of this crop.

Our genial climate, long growing season, and the rapidity with which the plant foods become available in the soils of the State throughout the entire year, all combine to make this erop one of especial importance

both in point of yield and ease of production.

From 1870 to 1879 the average acre-yield of corn in the State was 14.7 bushels. This average persisted until 1909, when the average acre-yield of corn rose to 18.4 bushels, and in 1913 when it was 19.5 bushels per acre. The Division of Demonstration grew an average of over 44 bushels per acre on 4,800 acres of land in North Carolina in 1911. The amount of corn grown in the State in 1909 was 34,063,000 bushels and in 1910 nearly 57,139,000 bushels. The value of our corn crop in 1909 was \$28,954,000; in 1910, \$43,426,000; in 1911, \$40,738,000; in 1912, \$42,428,000; and in 1913, \$48,648,000.

Wheat.

Wheat is rapidly gaining in importance as a staple crop in North Carolina. We have most excellent wheat lands in the State, but on account of the low prices of all farm products, until comparatively recently, the wheat crop has not been pushed cotton having largely taken

its place even on our best wheat lands.

We can grow wheat and in large amounts. Every man remembers, when a school boy, to have had his especial attention called to California on account of its phenomenal yield of wheat, sometimes as high as 50 bushels to the acre having been reported. It is interesting to note that while the wheat crop of California has always been good, the average yield in that State has frequently fallen below the average yield in North Carolina. There have been as large yields of wheat obtained in this as, perhaps, almost any state in the Union-not yields from individual acres, but from whole farms. There is a large farm in Halifax County on which there was grown last year an average of 281/2 bushels to the acre on a 140-acre field. In Johnston County a gentleman grew an average of 42 bushels to the acre on a 50-acre field, with individual acres yielding as high as 50 bushels. In Randolph County a gentleman grew an average of 27 bushels per acre on a 40-acre field. In Davidson County a farmer grew an average of over 30 bushels per acre on a 130-acre tract. But we need not multiply examples. Suffice it to say that these yields were gotten by the practice of common-sense methods on lands adapted by nature, or by preparation, to the growth of wheat. These yields may be duplicated by any farmer who has good heavy clay loam or silt loam soil and is willing to treat it properly.

The wheat crop in North Carolina in 1909 was 3,827,000 bushels; in 1910, 6.817,000 bushels; in 1911, 6,636,000 bushels; in 1912, 5,322,000

bushels; and, in 1913, 7,078,000 bushels.

Cotton.

Notwithstanding we are on the northern limit of the cotton belt, a large amount of this staple crop is produced every year—indeed we have a few counties that are unexcelled in cotton production. Last year it was the boast of Robeson, one of the largest counties in the State, that it produced a bale of cotton to every man, woman, and child in it.

The cotton crop is at present the most valuable single crop in the State, ranging in value between \$50,000,000 and \$60,000,000 per annum.

The total cotton crop for North Carolina in 1906 was 579,326 bales. Since then we have gradually increased the total yield until in 1911 we produced the maximum crop in the history of the State, amounting to 1,075,826 bales. It is true that in 1911 we had greater acreage than in any other year since 1906, but the yield per acre, which should always be the basis of calculation in comparing farm crops, was considerably more than that of any other recognized cotton-growing State in the Union. We, are, therefore, not only increasing the total yield of this product, but we seem to be doing better farming than we have done in past years.

^{*}Taken from United States Year Book for 1913.

Live Stock.

The number of live stock in North Carolina could be greatly increased to the advantage of every farmer in the State. We have not nearly as much live stock as our farms require; and the quality is very inferior to that which could be desired. Nevertheless, within the last ten years the percentage of increase of live stock in North Carolina has been greater than that of any of the thirty-eight states shown in the following table. A glance at the table will show that the percentage of increase of live stock in North Carolina in the last ten years has been more than double that of New York, Iowa, Colorado, Pennsylvania, Kansas, Texas, and West Virginia, and considerably more than that of Missouria, Michigan, Wisconsin and Illinois.

In 1913 North Carolina had 312,000 milch cows and 92,000 other cattle. There were 181,000 sheep on the farms and 1,335,000 hogs.

Table No. 6.—Showing Percentage Increase in Number of Live Stock in North Carolina as Compared with Other States— 1900-1910.*

New Hampshire	12.8

MANUFACTURED PRODUCTS.

In 1904 the State of North Carolina had 3,272 manufacturing establishments, which gave employment to an average of 93,142 persons during the year and paid \$25,170,000 in salaries and wages. In 1909 there were 49,931 manufacturing establishments, giving employment to 133,453 persons and paying out during the year \$41,259,000 in salaries and wages. This shows the rate at which manufacturing enterprises are increasing in this State. The value of the total manufactured products of the State in 1910 was \$216,656,000, which was over \$13,500,000 more than Georgia, our closest competitor in the South. The following table will show at a glance how North Carolina ranks as a manufacturing state. While it is not the first in value of manufactured products it is ahead of a great many others.

Table No. 7.—Showing Rank of North Carolina in Manufactured Products as Compared with Other States in 1910.

North Carolina	\$216,656.000
Georgia	202,863,000
Nebraska	199,019,000
Tennessee	180,217,000
Maine	176,029,000
New Hampshire	164,581,000
West Virginia	161,950,000
Alabama	145,962,000
Colorado	130,044,000
South Carolina	113,236,000
Oregon	93,005,000
Mississippi	80,555,000
Arkansas	74,916,000
Montana	73,272,000
Florida	72,890,000
Vermont	68,310,000
Utah	61,989,000
Oklahoma	53,682,000
Delaware	52,840,000
Arizona	50,267,000
District of Columbia	25,289,000
Idaho	22,400,000
North Dakota	19,138,000

South Dakota	17,870,000
Nevada	11,887,000
New Mexico	7,898,000
Wyoming	6,249,000

No state can turn out such an enormous amount of manufactured products without taxing to the utmost its agricultural resources. Cotton and other raw materials for manufacture, and for food supplies for men and necessary teams, must be produced on the farms, or imported from other states.

While the North Carolina farmer has made long and rapid strides in every line of agricultural development in the recent past, he is going to make even greater progress in the near future. The inducements for greater efforts are here. Our home markets are calling for more than we can produce with our present methods, and our neighboring markets

are yet not fully supplied.

By the introduction of improved implements and the most approved methods of tillage, fertilization, etc., the present annual crop yields can be more than doubled, and there is little doubt that they will be more than doubled in the near future. But even then, it is not likely that our present farming population can nearly supply the demands made on them for food and feed products. As our crop yields increase, the demand for the additional output will likewise increase. It would seem, therefore, that a very material addition to our farming population is imperative.

We have 22,439,129 acres of land in farms in North Carolina. Of this amount of land, only 8,813,056 acres are improved. This leaves 13,626,073 acres of unimproved land in farms. It is evident that this vast territory of nonproductive land should be brought under cultivation and made to contribute its share to the wealth of the State, and to do this would require about twice our present farming population.

As pointed out above, our markets are calling for more than we are producing, and, as a consequence, millions upon millions of dollars worth of food and feed products are yearly being shipped into the State

from outside sources.

FOOD PRODUCTS SHIPPED INTO THE STATE OF NORTH CAROLINA DURING 1913.

Three years ago the Division of Botany and Agronomy was directed to ascertain, as far as possible, the amount of food and feed products shipped into the State during 1911. The results of that investigation showed that around \$39,000,000 worth of these products were shipped into North Carolina during that year. This year, 1914, the Commissioner of Agriculture again directed this Division to make a similar investigation for the same purpose. Using the same method of investigation as we used before, we addressed a letter to each of the railroad companies operating inter-state lines of railroad, asking them to furnish us with such data as might be available to show the amount of various food and feed products shipped into the State over their lines during 1913.

We are pleased to state that all of the leading lines of railroads responded promptly to this request, except one, and gave us figures

taken directly from their books. The Seaboard Air Line and four short lines of railroad failed to give us the data requested, and we were forced to estimate the products shipped in over these short lines in 1913 as the same as that shipped in over them during 1911. Since the Coast line and the Seaboard Air Line traverse pretty much the same territory we felt justified in estimating the shipments over these two lines as being about equal. This enables us to present fairly reliable data showing the amount of food and feed products shipped into the State over the different lines of railroads during 1913.

Southern Railway.

During the year 1913 the Southern Railway shipped into the territory traversed by its lines 3,347,064 bushels of corn; 142,065 bushels of wheat; 59,010 harrels of apples; 5,530,000 pounds of cured meat; 15,392,000 pounds of dressed beef; 2,880 cases of canned goods; 15,-825,000 pounds of vegetables; 16,512 tons of hay, and 779 tons of feedstuffs.

Norfolk and Western Railroad.

The Norfolk and Western Railroad shipped into the territory traversed by its lines during 1913, 2,712,292 bushels of corn; 435,078 bushels of wheat; 263,567 bushels of oats; 8,607 barrels of apples; 69,188 pounds of dried fruit; 1,529,088 pounds of cured meat; 895,886 pounds of fresh pork; 21 barrels of barreled pork; 1,157,792 pounds of dressed beef; 2,222 pounds of corned beef; 2,955 pounds of butter; 113,631 pounds of cheese; 24,571 cases of canned goods; 47,124 gallons of syrup; 2,621 pounds of honey; 2,783 tons of hay; 10,578 tons of feedstuffs, and 2,650 dozen of eggs.

Winston-Salem Southbound.

During the year 1913 this branch of the Norfolk and Western shipped into middle North Carolina 11,389 bushels of corn; 20,830 bushels of wheat; 53,860 bushels of oats; 611 barrels of apples; 16,065 pounds of dried fruit; 109,051 pounds of cured meat; 20,000 pounds of fresh pork; 2,000 pounds of corned beef; 1,350 pounds of butter; 8,050 pounds of cheese; 6,278 cases of canned goods; 14,800 gallons of syrup; 862 pounds of honey; 1,182 tons of hay; 866 tons of feedstuff, and 264 dozen eggs.

Atlantic Coast Line.

This road shipped into Eastern North Carolina during the year 1913 1,773,936 bushels of corn; 1,649,850 bushels of wheat in the form of flour, and 29,570 tons of hay.

Norfolk Southern Railway.

This road shipped into Eastern North Carolina during 1913 726,056 bushels of corn; 1,070,541 bushels of wheat in the form of flour; 47,023 tons of mill feed; 17,857 tons of hay; 940,000 pounds of dressed meat; 13,078,000 pounds of other packing-house products and 2,762,000 pounds of other animal products as leather, hides, butter, eggs, etc.

Seaboard Air Line Railway.

The estimated amounts of products shipped into that part of the State traversed by this system during 1913 were 1,773,936 bushels of corn; 1,649,850 bushels of wheat and 29,570 tons of hay.

Mount Airy and Eastern Railway.

This road shipped into the State from the North and West during 1913, 12 bushels of corn; 242 barrels of apples; 2,300 pounds of dried fruit; 53 cases of canned goods; 150 pounds of pork, and 99 bushels of potatoes.

East Tennessee and Western North Carolina Railroad.

This railroad shipped into the mountain section of North Carolina during 1913 25,952 bushels of corn; 115 bushels of wheat; 13,576 bushels of oats; 10,466 barrels of flour; 60 barrels of apples; 120 pounds of dried fruit; 232,231 pounds of cured meat; 1,847 pounds of fresh pork; 1,149 pounds of dressed beef; 830 pounds of canned beef; 160 pounds of butter; 8,373 pounds of cheese; 3,808 cases of canned goods; 38 gallons of syrup; 3,659 pounds of honey; 140 pounds of vegetables; 241 tons of hay, and 802 tons of feedstuff. Estimated for 1913.

Danville and Western Railway.

It is estimated that this road shipped into Rockingham County during 1913 17,835 bushels of corn; 30,104 bushels of wheat; 7,161 bushels of oats; 111,138 barrels of flour; 1,348 barrels of apples; 6,050 pounds of dried fruit; 133,528 pounds of cured meat; 4,600 pounds of fresh pork; 2,000 barrels of barreled pork; 3,580 pounds of corned beef; 872 pounds of butter; 157,666 pounds of cheese; 6,591 cases of canned goods; 9,500 gallons of syrup; 1,638 pounds of honey; 96,000 pounds of vegetables and 2,240 tons of hay and 1,045 tons of feedstuff.

Tallulah Falls Railway.

It is estimated that this short line of railroad shipped into Western North Carolina during the period under discussion 7,643 bushels of corn; 3,397 barrels of flour; 492,000 pounds of cured meat; 26 tons of hay, and 85 tons of feedstuff.

Carolina, Clinchfield and Ohio Railway.

It is estimated that the Carolina, Clinchfield and Ohio Railway shipped into Northwestern North Carolina during 1913 50,526 bushels of corn; 173 bushels of wheat; 9,211 bushels of oats; 12,600 barrels of flour; 52 barrels of apples; 182,925 pounds of cured meat; 3,606 pounds of fresh pork; 15 barrels of barreled pork; 450 pounds of dressed beef; 30,051 pounds of corned beef; 215 pounds of butter; 7,043 pounds of cheese; 14,718 cases of canned goods; 1,908 pounds of honey; 9,066 tons of hay, and 4,939 tons of feedstuff.

Table No. 9.—Showing Comparative Values of Food and Feed Products Shipped Into North Carolina During 1911 and 1913.

	1911.	1913.
Corn @ 80c. bushel	\$4,346,420.80	\$6,404,672.80
Wheat @ \$1.00 a bushel	4,378,316.00	5,686,647.00
Oats @ 50c. a bushel	119,966.00	173,687.00
Apples @ \$5.00 a barrel	357,105.00	349,650.00
Dried fruit @ 10c. a pound	19,420.30	9,432.30
Cured meat @ 12½c. a pound	6,666,429.62	1,027,102.87
Fresh pork @ 10c. a pound	37,664.30	92,608.90
Barreled pork @ \$25 a barrel of 200 pounds	55,875.00	50,900.00
Dressed Beef @ 12½c. a pound	12,937.00	7,085.25
Miscellaneous packing house products @ 10c.		1,307,800.00
Butter @ 20c. a pound	875.20	1,110.40
Cheese @ 12½c. a pound	39,057.37	36,845.37
Canned goods @ \$2.50 a case	116,257.50	147,247.50
Syrup @ 40c. a gallon	21,110.80	28,584.80
Honey @ 10c. a pound	789.50	1,068.80
Vegetables @ 5c. a pound	3,516,716.45	6,637.00
Hay @ \$20 a ton	15,607,820.00	2,160,940.00
Feed stuffs—bran, shorts etc., @ \$25 a ton	2,225,625.00	1,650,425.00
Total	\$39,640,885.55	\$20,716,671.68
Balance in favor of 1913		\$19,124,213.87

The above figures, most of which were taken direct from the books of the different railroad companies doing an inter-state business, seem to be the closest approximation possible to the actual facts, and while it is not claimed that these figures are within even a million dollars of correct, due to the impracticability of getting any but the leading items of import, they still show that the state has decreased its imports enormously within the last three or four years, and is thus waking to the possibility and necessity of producing its own food supplies. Our people are beginning to live at home.

LETTER OF TRANSMITTAL.

HON. W. A. GRAHAM,

November 1, 1914.

Commissioner of Agriculture,

Raleigh, N. C.

SIR:—I submit herewith manuscript covering the investigations that have been made during the past year under the State Food Law, Chapter 368, Laws of 1907. I recommend its publication as the December Bulletin and Fifteenth Annual Food Report.

Respectfully submitted,

W. M. ALLEN,

Approved:

State Food and Oil Chemist.

W. A. GRAHAM,

Commissioner of Agriculture.

REPORT ON FOOD ADULTERATION FOR 1914.

BY W. M. ALLEN, STATE FOOD AND OIL CHEMIST, ASSISTED BY

E. W. THORNTON, ASSISTANT CHEMIST, C. E. BELL, ASSISTANT CHEMIST.

Report on Food Adulteration and the Enforcement of Food Law for 1914—the fifteenth annual report on the subject.

THE ENFORCEMENT OF THE LAW.

The State Food Law, chapter 368, Public Laws of North Carolina, 1907, makes it the duty of the State Department of Agriculture to enforce the food law. The law provides that the Board of Agriculture shall adopt and publish standards of strength and purity for food products and regulations for the enforcement of the law. Such standards and regulations have been adopted and published in the Annual Food Reports from time to time, as well as in pamphlet form, and have been sent to the dealers of the State, and will be sent on application to any citizen of the State.

The Department has spent a great deal of time and money during the past fourteen years trying to show the dealers of the State the requirements of the food law and how to comply with the same. As the dealers have now had time and opportunity to know the law and its requirements, it will be the policy of the Department to prosecute cases when similar ones have in the past been dismissed because of lack of information on the part of the dealer in regard to the law and its requirements.

EXTRACT FROM FOOD LAW.

NOTE ON.

The following extract from the Pure Food Law is very important, and the same is herewith printed in order that the grocerymen may become more familiar with the requirements of the law.

State Food Law, section 6, defines and describes what constitutes food adulteration. Section 7 defines and describes what constitutes the misbranding of food products. Section 9 provides for a guaranty by which the retail dealer may be exempt from prosecution for violation of the law.

EXTRACT FROM FOOD LAW.

Sec. 6. That for the purpose of this act an article shall be deemed to be adulterated, in the case of food—

First. If any substance has been mixed or packed with it so as to reduce

or lower or injuriously affect its quality or strength.

Second. If any substance has been substituted, wholly or in part, for the article.

Third. If any valuable constituent of the article has been wholly or in part abstracted.

Fourth. If it be mixed, colored, powdered, coated, or stained in a manner whereby damage or inferiority is concealed.

Fifth. If it contains any added poisonous or other added deleterious ingredient which may render such article injurious to health. If it contains any of the following substances, which are hereby declared deleterious and dangerous to health when added to human food, to wit: colors which contain antimony, arsenic, barium, lead, cadmium, chromium, copper, mercury, uranium, or zinc; or the following colors: gamboge, corallin, picric acid, aniline, or any of the coal-tar dyes; saccharine, dulcin, glucin, or any other artificially or synthetically prepared substitute for sugar; paraffin, formaldehyde, beta-naphthol, abrastol, benzoic acid or benzoates, salicylic acid or salicylates, boric acid or borates, sulphurous acid or sulphites, hydrofluoric acid or any flourine compounds, sulphuric acid or potassium sulphate or wood alcohol: Provided, that catsups and condimental sauces may, when the fact is plainly and legibly stated in the English language on the wrapper and label of the package in which it is retailed, contain not to exceed two-tenths of one per cent of benzoic acid or its equivalent in sodium benzoate. Fermented liquors may contain not to exceed two-tenths of one per cent of combined sulphuric acid, and not to exceed eight-thousandths of one per cent of sulphurous acid.

Sixth. If it consists in whole or in part of a filthy, decomposed, or putrid animal or vegetable substance, or any portion of an animal unfit for food, whether manufactured or not, or if it is the product of a diseased animal or one that had died otherwise than by slaughter. In addition to the ways already provided, sausage shall be deemed to be adulterated if it is composed in any part of liver, lungs, kidneys, or other viscera of animals: *Provided*, that the use of animal intestines as sausage casings shall not be deemed to be an adulteration.

Seventh. If it differs in strength, quality, or purity from the standards of purity of food products that have been or may be from time to time adopted by the Board of Agriculture.

Sec. 7. That the term "misbranded," as used herein, shall apply to all drugs or articles of food, or articles which enter into the composition of food, the package or label of which shall bear any statement, design, or device regarding such article or the ingredients or substances contained therein which shall be false or misleading in any particular, and to any food or drug product which is falsely branded as to the State, Territory, or country in which it is manufactured or produced.

That for the purpose of this act an article shall also be deemed to be mis-

branded, in the case of food-

First. If it be an imitation of or offered for sale under the distinctive name of another article.

Second. If it be labeled or branded so as to deceive or mislead the purchaser, or purport to be a foreign product when not so, or if the contents of the package as originally put up shall have been removed, in whole or in part, and other contents shall have been placed in such package, or if it fail to bear a statement on the label of the quantity or proportion of any morphine, opium, cocaine, heroin, alpha or beta cucaine, chloroform, canabis indica, chloral, hydrate or acetanilide, or any derivative or preparation of any such substances contained therein.

Third. If in package form, and the contents are stated in terms of weight or measure, they are not plainly and correctly stated on the outside of the

package.

Fourth. If the package containing it or its label shall bear any statement, design, or device regarding the ingredients or the substances contained therein which statement, design, or device shall be false or misleading in any particu-

lar: Provided, that an article of food which does not contain any added poisonous or deleterious ingredients shall not be deemed to be adulterated or

misbranded in the following cases:

First. In the case of mixtures or compounds which may be now or from time to time hereafter known as articles of food under their own distinctive names, and not an imitation of or offered for sale under the distinctive name of another article, if the name be accompanied on the same label or brand with a statement of the place where said article has been manufactured or produced.

Second. In the case of articles labeled, branded, or tagged so as to plainly indicate that they are compounds, imitations, or blends, and the word "compound," "imitation," or "blend," as the case may be, is plainly stated on the package in which it is offered for sale: Provided, the labeling is according to the rules prescribed by the Board of Agriculture: Provided, that the term "blend," as used herein, shall be construed to mean a mixture of like substances, not excluding harmless coloring or flavoring ingredients used for the purpose of coloring and flavoring only.

Sec. 9. That no dealer shall be prosecuted under the provisions of this act when he can establish a guaranty signed by the wholesaler, jobber, manufacturer, or other party, residing in North Carolina, from whom he purchased such article, to the effect that the same is not adulterated or misbranded

within the meaning of this act, designating it.

REGULATION ON LABELING.

A label must be, as far as possible, attached to each package, and contain, in addition to other information, the name of the material, the name and address of the manufacturer, importer, or jobber. When the words "artificial," "imitation," "compound," "adulterated," or other words of similar import, are required, they must be on the principal label and immediately precede or follow the word or words they modify, which must be the principal word or words of the label, and be in at least half the size and same style of type and on the same kind of background as the word or words with which they are closely associated. The principal words in the label must be printed in either dark-colored letters on a light-colored background or light-colored letters on a darkcolored background. Any statement that is required on the principal label of a barrel or cask of molasses, molasses compound, sirup or compound sirup, vinegar or compound vinegar, must appear on one end or head of the barrel or cask; and if the principal label or any part of it appears on both ends of barrel or cask, they shall be identical, one to the other.

The label on bottled soft drinks must bear the name and address of the bottler.

Where the presence of preservatives, coloring matter, or other substance or substances is required to be printed on the label, the printing must be done clearly and conspicuously on the label, in type not smaller than brevier heavy gothic caps, and on the same kind of background as the rest of the label.

Retail dealers, while offering food or beverage for sale, must keep the label so that it may be seen by purchaser or inspector, and the label must be kept so that it will remain legible.

NOTICE TO LOCAL DEALERS.

The attention of local dealers is especially called to the sale of compounds and imitations as straight food products. The sale of a compound or imitation food product is legal, provided it contains nothing deleterious to health and is sold under its own name as a compound or imitation, as the case may be. But the sale of a compound vinegar or of an imitation or spirit vinegar as vinegar is a violation of the law.

The sale of butterine or renovated butter as butter is a violation of

the law.

The sale of a compound coffee and chicory as coffee is a violation of the law.

The sale of a compound sirup or a mixture of glucose or corn sirup and refiners' sirup as sirup is a violation of the law.

The sale of filled cheese, or skim-milk cheese, or cheese below standard in milk fat as cheese is a violation of the law.

The sale of compound ice-cream or an ice-cream below standard in butter fat as ice-cream, without making the fact known to the purchaser, is a violation of the law.

The sale of canned vegetables colored with copper sulphate is a violation of the law.

The attention of dealers is again especially called to the definitions and standards for the above products, reported elsewhere in this Bulletin.

WORK OF THE YEAR 1914.

During the year, 1,323 samples of foods and beverages have been analyzed.

SUMMARY OF RESULTS OF THE EXAMINATION OF FOOD PRODUCTS.

Name of Sample.	Number of Samples Examined.
Beers and imitation and near-beers*	34
Butter and butter substitutes	29

^{*}Examined for alcohol only.

BEERS, IMITATION AND NEAR-BEERS.

DEFINITIONS AND STANDARDS.

Malt liquor is a beverage made by the alcoholic fermentation of an infusion, in potable water, of barley malt and hops, with or without unmalted grains.

Beer is a malt liquor produced by bottom fermentation, and contains not less than 5.00 per cent of extractive matter and 0.16 per cent of ash, chiefly potassium phosphate, and not less than 2.75 per cent of alcohol by volume.

Lager beer is beer which has been stored in casks for a period not less than three months, and contains not less than 3.00 per cent of alcohol by volume.

The presence of alcohol in these products is not objectionable under the food law, and, therefore, no official samples were examined.

The samples, the results of the examination of which are published in table below, were sent to the Department for analysis by county and city officials whose duty it is to enforce the prohibition law. This Department has no authority or funds for work under the latter law, and only determines the alcohol in samples for the above officials to assist them in the performance of their duties.

As the samples were not official under the Food Law, they were only tested for alcohol, as requested by the officials who sent them to the Department.

BUTTER AND BUTTER SUBSTITUTES.

DEFINITIONS AND STANDARDS.

Butter is the clean, nonrancid product made by gathering in any manner the fat of fresh or ripened milk or cream into a mass, which also contains a small portion of the other milk constituents, with or without salt, and contains not less than 82.50 per cent of milk fat and not more than 16 per cent of water.

Renovated butter, process butter, is the product made by melting butter and working, without the addition or use of chemicals or any substance except milk, cream, or salt, and contains at least 82.50 per cent of milk fat and not more than 16 per cent of water.

Oleomargarine, oleo or butterine, is a substitute for butter, made from other and cheaper fats than butter.

Of the 29 samples of butter and butter substitutes examined, seven were renovated or process butter. Of the 7 samples of process or renovated butter examined, one was sold as process butter and the other six were sold as butter or tub butter, in violation of the food law. In the above six cases the inspector asked for butter or tub butter. Instead

of getting butter, as asked for, he received process or renovated butter, without any statement to that effect being made.

It seems to be quite a custom among the retail dealers of the State to buy process or renovated butter, plainly labeled process butter, and to sell it at retail from the original package as butter.

The United States Department of Agriculture has amended Regulation 21, governing the labeling of renovated butter, to read as follows:

"All coverings or wrappers of prints, bricks, or rolls of renovated butter, whether paper or cloth, must have the words 'Renovated Butter' in one or two lines, marked, branded, stenciled, or printed thereon in black or nearly black upon white or light ground, in full-faced gothic letters not less than three-eighths of an inch square, so placed as to be the only marking upon one side or surface of the parcel so packed."

The Government authorities recognize the fact that renovated butter is not butter and should not be sold as butter. The above regulation makes it necessary for each package of renovated butter offered for sale in interstate commerce to be labeled so as to plainly show that it is renovated butter. The sale of renovated butter as butter is a violation of the State Food Law, and if detected will have to be prosecuted.

CHEESE.

Cheese is the sound, solid, and ripened product made from milk and cream by coagulating the casein thereof with rennet or lactic acid, with or without the addition of ripening ferments and seasoning, and contains, in the water-free substance, not less than 50 per cent of milk fat.

Skim-milk cheese or part skim-milk cheese is the sound, solid, and ripened product made from skim-milk or part skim-milk.

A product of this kind containing less than 50 per cent of milk fat in the water-free substance must be sold as skim-milk cheese or as part skim-milk cheese, as the case may be, or under some name that will indicate to the purchaser that it is not a standard cheese.

On account of the way cheese is sold at retail, it is an easy matter for

a dealer to buy skim-milk cheese and sell same to his customers as cheese, and it seems to be quite the practice to do so—at least, they often sell skim-milk cheese as cheese.

A product made as above described, that contains less than 50 per cent milk fat in the water-free substance, cannot be legally sold as cheese, but must be sold as skim-milk cheese or part skim-milk cheese, as the case may be.

The Food Law provides that if a food product is below standard, it is deemed to be adulterated and its sale illegal.

Dealers are cautioned that the sale of skim-milk cheese as cheese is illegal, and will have to be prosecuted under the Food Law.

The results of the examination of 38 samples, made during the year, will be found in the table below, with conclusions drawn from same.

CIDER AND IMITATION CIDERS.

Cider is a product made by the normal alcoholic fermentation of apple juice, and the usual cellar treatment, and contains not more than 7 per cent of alcohol by volume, not less than 2 per cent and not more than 12 per cent of solids, not more than 8 per cent of reducing sugars, and not less than 0.2 per cent nor more than 0.4 per cent of cider ash.

Cider, to comply with the North Carolina Food Law, must be made entirely of unadulterated apple juice. A product made from the juice of any other fruit than apples, if offered for sale, must bear the name of the fruit from which it is made. If artificial color or flavor is added, the fact must be stated on the label, and the product must be sold as a compound or an imitation cider; otherwise it will be classed as adulterated or misbranded, and the sale prohibited.

The sale of compound and imitation cider is legal, provided it contains nothing deleterious to health and is sold under its own name, compound cider, or imitation cider; but the sale of a compound cider or imitation cider as cider is a violation of the law.

The 26 samples reported below were sent to the Department by city and county officials whose duty it is to enforce the prohibition law. The Department has no authority of law or funds for work under the prohibition law, but as the State makes no provision for the determination of alcohol in beverages, and as it is necessary to know the amount of alcohol present in many cases to enforce the law, the Department of Agriculture does this work when it can be done without interfering with the duties of the Department.

CINNAMON EXTRACT.

DEFINITIONS AND STANDARDS.

Cinnamon extract is the flavoring extract prepared from oil of cinnamon, and contains not less than 2 per cent by volume of oil of cinnamon.

Oil of cinnamon is the lead-free volatile oil obtained from the bark of the Ceylon cinnamon tree, and contains not less than 65 per cent by weight of cinnamic aldehyde and not more than 10 per cent by weight of eugenol.

Only five samples of cinnamon extract were examined, one of which is below standard, containing only 0.60 per cent of cinnamon oil, when it should contain not less than 2 per cent of oil, and is, therefore, adulterated. One of the five samples was branded Cassia Cinnamon, when it was an extract. Cinnamon is the bark of the cinnamon tree, and not an extract. The sale of the sample as cinnamon extract would be legal, but its sale as cinnamon is illegal.

			cinnamon; sale as cinnamon illegal.

COFFEE AND COFFEE SUBSTITUTES.

DEFINITIONS AND STANDARDS.

Coffee is the seed of a small tree, coffee, whose fleshy fruit is about the size of a small cherry, and contains two seeds joined on their flat sides, which when freed from the pulp and the enveloping membrane are the coffee beans of commerce.

Roasted coffce is coffee which by the action of heat has become brown and developed its characteristic aroma, and contains not less than 10 per cent of fat and 3 per cent of ash.

The principal action or stimulating constituent of coffee is caffeine, a white, bitter crystallizable substance.

The principal material which is used to mix with and adulterate coffee is chicory, though cereals and leguminous seeds, such as wheat, rye, barley, beans, and peas are often used. Many brands of so-called coffee on the market contain from 20 to 60 per cent of chicory. The manufacturers of these products generally claim that the chicory is added, not to adulterate, but to actually improve the quality and to give

strength to the coffee. This claim is misleading to the public. Roasted chicory contains a large amount of caramel and starchy matter, that impart to the product, when made into a liquid for use as a beverage, a black, thick, soup-like appearance. The effect produced in coffee by chicory can no more correctly be regarded as adding strength to the coffee than if so much roasted starch and caramel had been added to it. Chicory is not added to coffee to give it strength, but to cheapen the product.

The addition of chicory or any other substance to coffee, without stating the fact on the label, is a violation of the law. Chicory and cereals cost less than one-fifth the price of coffee. Then, why pay the price of coffee for chicory and cereals when the latter are mixed with coffee?

Fifty-eight samples of these products were examined, and all were properly branded except three. They were branded Coffee and Chicory, when the chicory, being in excess, should come first in the name, and read Chicory and Coffee.

The results of the examination are published in the table below.

CURRANTS, FIGS, DATES, AND RAISINS, DRIED.

DEFINITIONS.

Fruits are the clean, sound, edible, flesh fructifications of plants, distinguished by their sweet, acid, and ethereal flavor.

Dried fruit is the clean, sound product made by drying mature, properly prepared, fresh fruit in such a way as to take up no harmful substance, and conforms in name to the fruit used in its preparation.

Thirty samples of dried figs, currants, dates, and raisins were examined. The examination was physical, and the object was to see if they were in good condition, free from worms, bugs, etc., and fit for human food.

Some of the samples were taken in the winter and others during the

summer months. The samples taken during the winter were found to be in good condition, but sixteen of those taken after the weather was warm contained worms, bugs, etc., and were unfit for food.

The law says that a product shall be deemed to be adulterated if it consists in whole or in part of a filthy, decomposed, or putrid animal or vegetable substance, or is otherwise unfit for food.

That such fruit containing worms, bugs, and excrement from same is unfit for food no one would deny. That being the case, dealers are cautioned about offering such fruit for sale during warm weather, when they are so likely to be in bad condition. If offered for sale after the weather is warm, such products should be looked into to see that they are all right.

14290 Figs, stuffed.

14087 Currants, dried; condition bad; contained bugs; unfit for food; sale illegal.

14281 Raisins, dried.

14094 Prunes, dried; condition bad; contained bugs; unfit for food; sale illegal.

14282 Dates, dried.

14283 Raisins, seeded, dried.

14285 Figs, dried.

Many products, such as eggs, gelatine, etc., are used in the manufacture of so-called ice-cream, which is often very palatable, but which is not ice-cream, and if sold as such is a violation of the law.

Realizing that many dealers would desire to sell and many consumers desire to obtain cheaper products than a standard ice-cream, the Board of Agriculture made a regulation under which any product, not deleterious to health, can be legally sold in the State. The regulation merely provides that if the dealer will make known by placard or label the kind of product offered for sale by him, the Department will not contest the sale.

REGULATION OF SALE OF ICE-CREAM SUBSTITUTES.

The sale of a product as ice-cream, containing gelatine, eggs, gum tragacanth or other vegetable gums, or the sale of a product as ice-cream which contains less than the required per cent of milk fat will not be contested: *Provided*, the same is labeled and sold as imitation ice-cream, compound ice-cream, gelatine ice-cream, egg ice-cream, milk ice-cream, or gum ice-cream (as the case may be); or if a placard bearing the following statement—

"Imitation ice-cream is served here."

"Compound ice-cream is served here."

"Egg ice-cream is served here."

"Gelatine ice-cream is served here."

"Milk ice-cream is served here," or

"Gum ice-cream is served here,"

(as the case may be) shall be posted in a conspicuous place in the room where any and all persons may see the same when purchasing cream;

and Provided further, that the statement on the placard is printed in plain black letters, not less than one inch in size, on a white background.

During the past year 165 samples of ice-cream and ice-cream substitutes have been examined, many of which were below standard and sold in violation of the law. Many that were below standard were not sold in violation of the law, as the dealers had placards in their places of business, as provided for by regulations, showing that the products offered for sale were not ice-cream, but were substitutes for same. If one wishes to buy an inferior product, he has a right to do so, and the Department has no objection to the sale, provided the dealer makes known to the purchaser what he is getting for his money. On the other hand, if the purchaser wishes a good product and pays the price of same, he has a right to expect and to get what he pays for.

Dealers are again cautioned that the sale of products as ice-cream that do not meet the requirements will be prosecuted unless the dealer complies with the regulation on sale of ice-cream.

LARD AND COMPOUND LARD.

DEFINITIONS AND STANDARDS.

- 1. Lard is the rendered fresh fat from hogs in good health at the time of slaughter, is clean, free from rancidity, and contains, necessarily incorporated in the process of rendering, not more than one (1) per cent of substances, other than fatty acids and fat.
- 2. Leaf lard is lard rendered at moderately high temperatures from the internal fat of the abdomen of the hog, excluding that adherent to the intestines, and has an iodine number not greater than sixty (60).
 - 3. Neutral lard is lard rendered at low temperatures.

13853	6.60	26.00	Ice-cream, vanilla, below standard; adulterated; no sign; sale illegal.						

There is no standard for compound lard, it being a mixture or compound of fats, but as found on the market it is usually cotton-seed oil with enough beef stearin (oleostearin) to give it the requisite degree of solidity or consistence and a small amount of real lard. Lard stearin or cotton-seed stearin may be used in place of the beef stearin.

Fifteen samples of lard and lard substitutes have been examined during the year, and two of them were sold as lard when they were com-

pound lards.

The sale of compound lard is all right, provided it is sold as compound lard; but the sale of a compound lard as lard is a violation of the law, and will have to be prosecuted.

LEMON EXTRACTS AND LEMON EXTRACT SUBSTITUTES.

DEFINITIONS AND STANDARDS.

Lemon extract is the flavoring extract prepared from oil of lemon, or from lemon peel, or both, and contains not less than 5 per cent by volume of oil of lemon.

Oil of lemon is the volatile oil obtained from the fresh peel of the lemon.

Terpeneless extract of lemon is the flavoring extract prepared by shaking oil of lemon with dilute alcohol, or by dissolving terpeneless oil of lemon in dilute alcohol, and contains not less than two-tenths (0.2) per cent by weight of citral, derived from oil of lemon.

Compound lemon extract is the flavoring product containing more than 50 per cent of lemon extract with some other flavoring as a substitute for lemon, such as citral, etc.

13523	do	51.0	1.4600	58.6	do.

Imitation lemon extract is a flavoring product made from citral or other substitutes for lemon oil, and contains little or no lemon oil.

Substitutes for lemon extract are usually of very little value as a flavoring material; but if properly labeled or branded just what they are, their sale is legal, provided they contain nothing deleterious to health, such as wood alcohol, etc. Wood alcohol is a dangerous poison. A small amount is liable to produce death, and even a smaller amount may produce total and permanent blindness.

Consumers should observe the label and demand the real extract, as it is worth far more than the difference in the price between the substitute and the real extract.

Results of the examination of the samples for the year are printed in the table below.

MAPLE SIRUP AND MAPLE SIRUP SUBSTITUTES.

DEFINITIONS AND STANDARDS.

Sirup is the sound product made by purifying and evaporating the juice of a sugar-producing plant without removing any of the sugar.

Maple sirup is sirup made by the evaporation of maple sap or by the solution of maple concrete, and contains not more than 32 per cent of water and not less than 0.45 per cent of maple sirup ash.

The principal adulteration found in maple sirup is the addition of refiner's sugar sirup, the maple sirup present being depended on to flavor the whole, though the maple flavor is often reinforced by the addition of an extract of bark or an imitation flavor. Before the food laws were enforced maple sirups were adulterated with glucose sirup and the imitation flavor; but as maple sirup consists largely of sucrose or ordinary sugar, the presence of added cane sugar is more difficult to detect than the presence of glucose sirup. However, the addition of cane sugar

sirup can be detected by the determination of minor constituents which occur in maple products only.

The manufacturers of these products often use labels that, while not in open violation of the law, are easily misleading to the unsuspecting

MILK AND CREAM.

DEFINITIONS AND STANDARDS.

Milk is the fresh, clean, lacteal secretion obtained by the complete milking of one or more healthy cows properly fed and kept, excluding that obtained within fifteen days before and ten days after calving, and contains not less than eight and one-half (8.5) per cent of solids not fat, and not less than three and one-quarter (3.25) per cent of milk fat.

Blended milk is milk modified in its composition so as to have a definite and stated percentage of one or more of its constituents.

Skim-milk is milk from which a part or all of the cream has been removed, and contains not less than nine and one-quarter (9.25) per cent of milk solids.

Cream is that portion of milk, rich in milk fat, which rises to the surface of milk on standing, or is separated from it by centrifugal force, is fresh and clean, and contains not less than eighteen (18) per cent of milk fat.

Under the head of milk and cream 103 samples of milk and 7 samples of cream have been examined. Of the 103 samples of milk, 25 were below standard, and of the 7 samples of cream 1 was slightly below standard.

The Food Law provides that a food product shall be deemed to be adulterated—

If any substance has been mixed or packed with it so as to reduce or lower or injuriously affect its quality or strength;

If its strength or purity falls below the standards that have been adopted by the Board of Agriculture.

The results of the examination indicate that water had been added to the milk, which reduced and lowered its quality or strength. The addition of water to milk makes the sale of same illegal, and the fact that 25 of the samples examined were below standard made their sale illegal.

See results in table below.

CONDENSED MILK.

DEFINITIONS AND STANDARDS.

Condensed milk, evaporated milk, is milk from which a considerable portion of water has been evaporated, and contains not less than 28 per cent of milk solids, of which not less than 27.5 per cent is milk fat.

Sweetened condensed milk is milk from which a considerable portion of water has been evaporated and to which sugar (sucrose) has been

added, and contains not less than 28 per cent of milk solids, of which not less than 27.5 per cent is milk fat.

Condensed skim-milk is skim-milk from which a considerable portion

of water has been evaporated.

Because of the condition of the standard, the results of the examination of 29 samples of unsweetened condensed milk, and condensed skimmilk are presented without comment in the table below.

These results can be used in comparing the quality or richness of

brands represented.

MOLASSES AND SIRUPS.

DEFINITIONS AND STANDARDS.

Sirup is the sound product made by purifying and evaporating the juice of a sugar-producing plant without removing any of the sugar.

Sugar-cane sirup is sirup made by the evaporation of the juice of the sugar-cane, or by the solution of sugar-cane concrete.

Sorghum sirup is sirup made by the evaporation of sorghum juice or by the solution of sorghum concrete.

Refiners' sirup is the residual liquid product obtained in the process of refining raw sugar.

Molasses is the product after separating the sugar from massecuite, melada, mush sugar, or concrete.

Molasses or sirup that is compounded or mixed with glucose or any other substance to cheapen or lower its quality must be labeled so as to plainly indicate what the product is. That is, a mixture of molasses and corn sirup, with the molasses in excess, would be properly labeled molasses and corn sirup. If the corn sirup is in excess, it should be labeled

Samples," and the conclusions drawn from the results of the analyses are published in the table below.

OF MISCELLANEOUS SAMPLES.

Laboratory Number.	Retail Dealer or Party Who Sent Sample for Analysis.	Remarks and Conclusions.
13065	J. B. Allen, Henderson, R. F. D.	Meat, ham, in bad condition; sale illegal.
19064	Mrs. I. J. Arden, Black Mountain	
	B. F. Dixon, Raleigh	Egg flip, alcohol (by volume), .65%.
13687		Extract of ginger; misbranded; sale illegal.
	Dr. L. A. Crowell, Lincoluton	Sugar, in which a little bluing was left in the manufacture.
	C. P. Davis, Colerain	Common salt; little impurity.
	John Lewis, Southern Pines	Baking powder, phosphate; low in carbon dioxide gas.
12066	J. W. Draper, Caraway	Common salt, small amount of magnesium chloride.
9818	P. W. Glidewell, Reidsville	Straight whiskey; properly aged.
	H. T. Hicks, Raleigh	Capudine; alcohol (by volume), 6.60%.
12890		Common salt; no impurity.
	B. F. Dixon, Raleigh	Egg flip; alcohol (by volume), 1.72%.
13736		Intoxicating; sale illegal.

13155	B. F. Dixon, Raleigh	Egg flip; alcohol (by volume), 2.92%.
	Capt. F. F. Brown, Raleigh	
1306	F. L. Wallard, U. S. Inspector, Raleigh	do.

corn sirup and molasses. Corn sirup containing a small amount of cane sirup should be labeled so as to plainly indicate the facts in the case. A label, "Corn and Cane Sirup," is not, in our judgment, a proper label for a product composed largely of corn sirup containing a small amount of cane sirup. A product so labeled should contain a material amount of the cane sirup.

Refiners' sirup is not cane sirup, and cannot be legally sold as such. Neither would a mixture of corn sirup and refiners' sirup be properly labeled if labeled corn and cane sirup. It should be labeled corn and

refiners' sirup or compound sirup.

Molasses and sirups seem to be much adulterated and misbranded. Some manufacturers are disposed to hide the truth in regard to the real character of compound sirups, while others label them plainly what they are, as will be seen by reference to the table below; but the greater number of violations in the sale of this class of products are committed by the retail dealers. They buy the products in bulk, labeled compound or with the name of the ingredients on the label, showing that it is a compound, and then they proceed to sell it as a pure product. Some

of these products are labeled corn and cane sirup, which label would appear to indicate about equal parts of each ingredient, when as a fact it is corn sirup or glucose flavored with or containing a small amount of cane sirup. Manufacturers often use the term cane sirup when the product is not cane sirup, but is refiners' sirup instead. They also label some of these compound sirups "Table Sirup." If a product contains corn sirup, glucose, or any other substance except one made

from the juice of a sugar-producing plant without removing any of the sugar, it is not a pure, true sirup, and cannot be properly labeled table sirup. Such products must be sold as compound sirup, refiners' sirup, or corn sirup, as the case may be.

Dealers are again cautioned not to sell these compound products as pure products. Their sale is all right, provided they are sold for what they are, but they must not be sold as pure products.

OLIVE AND OTHER TABLE AND COOKING OILS.

Olive oil is the oil obtained from the sound, mature fruit of the cultivated olive tree. It is a very choice table oil and is largely used. It was formerly much adulterated, but the enforcement of the food laws has reduced the adulteration of it to a minimum.

ORANGE EXTRACT AND ORANGE EXTRACT SUBSTITUTES.

DEFINITIONS AND STANDARDS.

Orange extract is the flavoring extract prepared from oil of orange, or from orange peel, or both, and contains not less than 5 per cent by volume of oil of orange. Oil of orange is the volatile oil obtained from the fresh peel of the orange.

RESULTS OF THE EXAMINATION OF ORANGE

Laboratory Number.	Material and Brand from Label.	Manufacturer or Wholesaler.	Retail Dealer or Party Who Sent Sample for Analysis.

CANNED PEAS.

DEFINITIONS AND STANDARDS.

Canned peas are sound, properly matured and prepared fresh peas sterilized by heat, kept in suitable, clean, hermetically sealed containers, from which they take up no metallic substance, and conform in name to the peas used in their preparation.

The State Food Law provides that a food product shall be deemed to be adulterated: If it be mixed, colored, powdered, coated, or stained in a manner whereby damage or infirmity is concealed, or if it contains any added poisonous or other added deleterious ingredient which may render such article injurious to health. It is and has been quite a practice among packers to green or artificially color canned vegetables with copper salts.

The question of whether the greening of vegetables for human food with copper salts constitutes a violation of the National Food Law was referred by the Secretary of Agriculture to the Referee Board of Consulting Scientific Experts in March of 1909. After an exhaustive investigation of the subject the "Referee Board" reports to the Secretary as follows:

13563 Peas, Yacht Club, R. Beziers...

"Copper salts used in the greening of vegetables may have the effect of concealing infirmity, inasmuch as the bright green color imparted to the vegetable simulates a state of freshness they may not have possessed before treatment.

"It appears from our investigation that, in certain directions, even such small quantities of copper may have a deleterious action and must

be considered injurious to health."

As the use in food of an ingredient which may render the latter injurious to health is a violation of the State Food Law, and as the Referee Board of Scientific Experts have said in their report that even a small quantity of copper may have a deleterious action and must be considered injurious to health, this Department will consider the sale in North Carolina of vegetables colored with copper salts a violation of the State Food Law.

The dealers of the State have had notice and been warned that such violations will be prosecuted under the law. Still some of them continue to offer products so adulterated for sale.

The results of the examination of samples during the year are published in table below.

RICE.

A large percentage of the rice on the market is coated or polished with glucose and talc.

Under the National Food Law, and the regulations of the United States Department of Agriculture, the use of tale and glucose as a coating for rice, in interstate commerce, is permitted, provided that the label of each package bears the following statement: "Coated with glucose and tale. Remove by washing."

Rice coated with glucose and talc, to comply with the requirements of

SALT FISH.

During the latter part of September the attention of the Food Officials was called to what appeared to be illness produced from eating salt fish, mullets.

It is not unusual for people to suspect that they have been made ill or poisoned by having eaten certain food, and present the matter to the Department to be investigated, without having much evidence upon which to base their suspicion.

In this case there appeared to be sufficient evidence to justify an investigation, which was made. The investigation showed further evidence of the fish causing the illness, and the sale of the suspected fish was stopped until complete investigation could be made.

Samples of the fish from several shipments, though all from the same pack, were obtained. Chemical test for preservatives and other poisons

the law must show that the rice is coated, and that same can be removed by washing.

Ten samples of rice were examined, three of which were uncoated and seven were coated. The labels of the coated samples did not show that the product was coated, as is required under both the State and the National laws, and the sale of these products was in violation of the law.

See results and conclusions in table below.

were made, but nothing was found that could have produced the trouble. As chemical tests showed nothing that could have produced the trouble, tests on living animals, cats, rats, and guinea pigs, were resorted to. It soon became evident that the fish, though they appeared to be sound, contained a deadly poison.

As it was a very serious matter, and the Department did not wish to condemn and have destroyed several hundred barrels of fish without the most positive proof that the use of same would be dangerous, the Bureau of Chemistry of the United States Department of Agriculture was asked to examine the fish also, and samples of same were sent for the purpose.

The report of the Bureau, through the Coöperative Division of same, confirmed the results obtained by this department, and advised that the fish did contain an unidentified poisonous substance, probably a protein decomposition product, which was responsible for the trouble, and

which was probably due to the fish having stood too long before being placed in the pickling brine. The report further advised that the use of the fish as food be prohibited.

The report of the United States Department completely confirming the results obtained by this Department, and it being impracticable to test each barrel, so as to separate any good that might be in the bad fish, the whole pack of fish—several hundred barrels—was condemned and the sale of same as food prohibited.

The matter was at once taken up with the packers of the fish, the Morehead City Sea Food Company, of Morehead City. Mr. C. S. Wallace, the president of the company, came to Raleigh and went, in detail, into the matter of packing the fish, and he stated most positively that the fish were not held an undue length of time before being placed in the brine and that same were packed under as clean, sanitary conditions as he had ever packed fish. He further states that the fish in question were packed in a new, clean fish house with concrete floor and plenty of clean, fresh water, while some of the same catch of fish, and from which no trouble has arisen, were packed under similar conditions, except they were packed in an old fish house which was not in as good condition as the new one referred to.

Unless some of the fish were caught at an earlier time and held by the fishermen and mixed at the bottom with a later catch, with the information in hand it is impossible to say why the fish packed at the old place were good and the fish packed at the new place were bad. As the

fish were unloaded from the boat at the old place first, coming from the top, they evidently represented the last part of the catch. As the fish packed at the new house were unloaded last, and came from the bottom of the boat, it is reasonable to suppose that they had been held longer by the fishermen before delivering them to the packers, and it is most likely that this is the reason for the fish packed at the old house being good while the fish packed at the new house, under better conditions, were bad.

Manufacturers, packers, and dealers are responsible for the condition of food products handled by them, and the packers of the bad fish are responsible for their condition, but it is to their credit that they were very active in helping to stop the sale of same, and when informed that the fish were bad beyond question, they readily and willingly consented for the fish to be destroyed.

The situation was serious; quite a few people had been made very ill, and probably a death or two had been caused by the fish, though at first there was no very positive proof of it. Had the Department and the packers of the fish not acted promptly in stopping the sale of same, it is likely that much illness would have been produced and many deaths would have occurred.

(With gratitude this Department acknowledges the assistance rendered in this matter by the Bureau of Chemistry, United States Department of Agriculture, through the Coöperative Division of the same.)

SWEET OIL AND SWEET OIL SUBSTITUTES.

Sweet oil is olive oil. Any oil other than olive oil branded sweet oil would be misbranded. It is not correct to label cotton-seed oil sweet oil, and elsewhere on the label describe the true character of the oil.

There seems to have been a difference of opinion as to what constitutes sweet oil. The Department in 1911 made an investigation of the subject and found that the only oil to which the term "sweet oil" may be correctly applied is olive oil. The United States Department of Agriculture in food inspection decision No. 139 has since that time held

that any oil other than olive oil is misbranded when sold under the name "Sweet Oil," and it is not correct to label cotton-seed oil as "sweet oil" and then elsewhere place on the label words to describe the true character of the oil.

This department does not wish to in any way discriminate against cotton-seed oil, for it is a good food product and justly deserves the good name it bears; but it is not sweet oil and cannot be legally sold as such.

The results of the examination of the 29 samples examined this year are published in the table below.

VANILLA EXTRACTS AND VANILLA EXTRACT SUBSTITUTES.

DEFINITIONS AND STANDARDS.

Vanilla extract is the flavoring extract prepared from vanilla bean, with or without sugar or glycerin, and contains in one hundred cubic centimeters (100 cc.) the soluble matters from not less than ten (10) grams of the vanilla bean.

The adulterants of vanilla extract are tonka bean extract, artificial vanillin, artificial coumarin, caramel and coal-tar colors. Artificial vanillin is the same as the chief flavoring principle of the vanilla bean, but the extract made from this substance lacks the flavor of genuine

vanilla extract, owing to the absence of other substances, which cannot be successfully imitated. Tonka beans are much cheaper than vanilla beans and have a ranker and more stringent flavor, due to coumarin, which is also prepared artificially for use in extracts.

The results of the examination of 64 samples are reported in the table below, and by reference to same the character of the adulteration and misbranding can be seen without repeating it here.

Many of the samples were sold in violation of the law, notwithstanding the dealers have been repeatedly cautioned about this and similar violations.

VINEGAR AND VINEGAR SUBSTITUTES.

VINEGAR STANDARDS.

Vinegar in the product made by the alcoholic and subsequent acetous fermentation of the juice of apples, and contains not less than 4.00 per cent of acetic acid, not less than 1.60 per cent of apple solids, of which not more than 50.00 per cent are reducing sugars, and not less than 0.25 per cent of apple ash.

Wine vinegar is the product made by the alcoholic and subsequent acetous fermentation of the juice of grapes, and contains not less than 4.00 per cent of acetic acid, not less than 1.00 per cent of grape solids, and not less than 0.13 per cent of grape ash.

Malt vinegar is the product made by the alcoholic and subsequent acetous fermentation, without distillation, of an infusion of barley malt or cereals whose starch has been converted by malt, is dextro-rotatory, and contains not less than 4.00 per cent of acetic acid, not less than 2.00 per cent of solids, and not less than 0.2 per cent of ash.

Spirit vinegar is the product made by the acctous fermentation of dilute distilled alcohol, and contains not less than 4.00 per cent acctic acid.

Under both the State and National Food Laws vinegar is a product of standard strength made from the juice of apples—that is vinegar, and nothing else is vinegar, and nothing else can be legally sold simply as vinegar. A 4 per cent solution of acetic acid in water, colored with caramel, is not vinegar and cannot be legally sold as such. It has the

TRACTS AND VANILLA EXTRACT SUBSTITUTES—Continued.

acid strength of vinegar, to be sure, but instead of having the delightful flavor and odor, so desirable in vinegar, it has nothing but a pungent, stinging odor and taste. So-called spirit vinegar is practically nothing but acetic acid in water, colored with caramel. Still, manufacturers and dealers want to sell it as vinegar. They also want to mix it in all proportions from 20 to 90 per cent, with vinegar and sell this mixture as vinegar.

The most frequent violation of the food law to-day is the sale of these so-called vinegars as vinegar by the retail dealers of the State. If the manufacturers or jobbers were to ship these products, labeled vinegar, from one State into another they would be prosecuted under the National law.

These products, shipped in barrels, are not often labeled or branded vinegar, but are labeled what they are, though many dealers in selling them at retail sell them as vinegar. When a sample of so-called vinegar is bought by an inspector as *vinegar*, and the dealer is notified that he has violated the food law in the sale of a product as vinegar which was not vinegar, he almost invariably replies that he thought it was vinegar. Had he looked at the label he would have seen that it was not vinegar.

During the year 311 samples of vinegar and so-called vinegar have been purchased from the dealers of the State and examined. The results of the examination of these samples are tabulated below.

Dealers are cautioned that the sale of so-called vinegar or adulterated vinegar as vinegar will be prosecuted.
